Preface to the fourth edition

The fourth edition is augmented by more than 70 new formulas. In particular, we have included some key concepts and results from trade theory, games of incomplete information and combinatorics. In addition there are scattered additions of new formulas in many chapters.

Again we are indebted to a number of people who has suggested corrections, improvements and new formulas. In particular, we would like to thank Jens-Henrik Madsen, Larry Karp, Harald Goldstein, and Geir Asheim.

In a reference book, errors are particularly destructive. We hope that readers who find our remaining errors will call them to our attention so that we may purge them from future editions.

Oslo and Berkeley, May 2005

From the preface to the third edition

The practice of economics requires a wide-ranging knowledge of formulas from mathematics, statistics, and mathematical economics. With this volume we hope to present a formulary tailored to the needs of students and working professionals in economics. In addition to a selection of mathematical and statistical formulas often used by economists, this volume contains many purely economic results and theorems. It contains just the formulas and the minimum commentary needed to relearn the mathematics involved. We have endeavored to state theorems at the level of generality economists might find useful. In contrast to the economic maxim, “everything is twice more continuously differentiable than it needs to be”, we have usually listed the regularity conditions for theorems to be true. We hope that we have achieved a level of explication that is accurate and useful without being pedantic.

During the work with this book we have had help from a large group of people. It grew out of a collection of mathematical formulas for economists originally compiled by Professor B. Thalberg and used for many years by Scandinavian students and economists. The subsequent editions were much improved by the suggestions and corrections of: G. Asheim, T. Akram, E. Biørn, T. Ellingsen, P. Frenger, I. Frihagen, H. Goldstein, F. Greulich, P. Hammond, U. Hassler, J. Heldal, Aa. Hylland, G. Judge, D. Lund, M. Machina, H. Mehlum, K. Moene, G. Nordén, A. Rødseth, T. Schweder, A. Seierstad, L. Simon, and B. Øksendal.

As for the present third edition, we want to thank in particular, Olav Bjerkholt, Jens-Henrik Madsen, and the translator to Japanese, Tan-no Tadanobu, for very useful suggestions.

Contents

1. Set Theory. Relations. Functions	1
Logical operators. Truth tables. Basic concepts of set theory. Cartesian products. Relations. Different types of orderings. Zorn's lemma. Functions. Inverse functions. Finite and countable sets. Mathematical induction.	
2. Equations. Functions of one variable. Complex numbers	7
Roots of quadratic and cubic equations. Cardano's formulas. Polynomials. Descartes's rule of signs. Classification of conics. Graphs of conics. Properties of functions. Asymptotes. Newton's approximation method. Tangents and normals. Powers, exponentials, and logarithms. Trigonometric and hyperbolic functions. Complex numbers. De Moivre's formula. Euler's formulas. n th roots.	
3. Limits. Continuity. Differentiation (one variable)	21
Limits. Continuity. Uniform continuity. The intermediate value theorem. Differentiable functions. General and special rules for differentiation. Mean value theorems. L'Hôpital's rule. Differentials.	
4. Partial derivatives	27
Partial derivatives. Young's theorem. C^k -functions. Chain rules. Differentials. Slopes of level curves. The implicit function theorem. Homogeneous functions. Euler's theorem. Homothetic functions. Gradients and directional derivatives. Tangent (hyper)planes. Supergradients and subgradients. Differentiability of transformations. Chain rule for transformations.	
5. Elasticities. Elasticities of substitution	35
Definition. Marshall's rule. General and special rules. Directional elasticities. The passus equation. Marginal rate of substitution. Elasticities of substitution.	
6. Systems of equations	39
General systems of equations. Jacobian matrices. The general implicit function theorem. Degrees of freedom. The "counting rule". Functional dependence. The Jacobian determinant. The inverse function theorem. Existence of local and global inverses. Gale–Nikaido theorems. Contraction mapping theorems. Brouwer's and Kakutani's fixed point theorems. Sublattices in \mathbb{R}^n . Tarski's fixed point theorem. General results on linear systems of equations.	

7. Inequalities	47
Triangle inequalities. Inequalities for arithmetic, geometric, and harmonic means. Bernoulli's inequality. Inequalities of Hölder, Cauchy–Schwarz, Chebyshev, Minkowski, and Jensen.	
8. Series. Taylor's formula	49
Arithmetic and geometric series. Convergence of infinite series. Convergence criteria. Absolute convergence. First- and second-order approximations. Maclaurin and Taylor formulas. Series expansions. Binomial coefficients. Newton's binomial formula. The multinomial formula. Summation formulas. Euler's constant.	
9. Integration	55
Indefinite integrals. General and special rules. Definite integrals. Convergence of integrals. The comparison test. Leibniz's formula. The gamma function. Stirling's formula. The beta function. The trapezoid formula. Simpson's formula. Multiple integrals.	
10. Difference equations	63
Solutions of linear equations of first, second, and higher order. Backward and forward solutions. Stability for linear systems. Schur's theorem. Matrix formulations. Stability of first-order nonlinear equations.	
11. Differential equations	69
Separable, projective, and logistic equations. Linear first-order equations. Bernoulli and Riccati equations. Exact equations. Integrating factors. Local and global existence theorems. Autonomous first-order equations. Stability. General linear equations. Variation of parameters. Second-order linear equations with constant coefficients. Euler's equation. General linear equations with constant coefficients. Stability of linear equations. Routh–Hurwitz's stability conditions. Normal systems. Linear systems. Matrix formulations. Resolvents. Local and global existence and uniqueness theorems. Autonomous systems. Equilibrium points. Integral curves. Local and global (asymptotic) stability. Periodic solutions. The Poincaré–Bendixson theorem. Liapunov theorems. Hyperbolic equilibrium points. Olech's theorem. Liapunov functions. Lotka–Volterra models. A local saddle point theorem. Partial differential equations of the first order. Quasilinear equations. Frobenius's theorem.	
12. Topology in Euclidean space	83
Basic concepts of point set topology. Convergence of sequences. Cauchy sequences. Cauchy's convergence criterion. Subsequences. Compact sets. Heine–Borel's theorem. Continuous functions. Relative topology. Uniform continuity. Pointwise and uniform convergence. Correspondences. Lower and upper hemicontinuity. Infimum and supremum. Lim inf and lim sup.	

-
- 13. Convexity** 89
 Convex sets. Convex hull. Carathéodory's theorem. Extreme points. Krein–Milman's theorem. Separation theorems. Concave and convex functions. Hessian matrices. Quasiconcave and quasiconvex functions. Bordered Hessians. Pseudoconcave and pseudoconvex functions.
- 14. Classical optimization** 97
 Basic definitions. The extreme value theorem. Stationary points. First-order conditions. Saddle points. One-variable results. Inflection points. Second-order conditions. Constrained optimization with equality constraints. Lagrange's method. Value functions and sensitivity. Properties of Lagrange multipliers. Envelope results.
- 15. Linear and nonlinear programming** 105
 Basic definitions and results. Duality. Shadow prices. Complementary slackness. Farkas's lemma. Kuhn–Tucker theorems. Saddle point results. Quasiconcave programming. Properties of the value function. An envelope result. Nonnegativity conditions.
- 16. Calculus of variations and optimal control theory** 111
 The simplest variational problem. Euler's equation. The Legendre condition. Sufficient conditions. Transversality conditions. Scrap value functions. More general variational problems. Control problems. The maximum principle. Mangasarian's and Arrow's sufficient conditions. Properties of the value function. Free terminal time problems. More general terminal conditions. Scrap value functions. Current value formulations. Linear quadratic problems. Infinite horizon. Mixed constraints. Pure state constraints. Mixed and pure state constraints.
- 17. Discrete dynamic optimization** 123
 Dynamic programming. The value function. The fundamental equations. A “control parameter free” formulation. Euler's vector difference equation. Infinite horizon. Discrete optimal control theory.
- 18. Vectors in \mathbb{R}^n . Abstract spaces** 127
 Linear dependence and independence. Subspaces. Bases. Scalar products. Norm of a vector. The angle between two vectors. Vector spaces. Metric spaces. Normed vector spaces. Banach spaces. Ascoli's theorem. Schauder's fixed point theorem. Fixed points for contraction mappings. Blackwell's sufficient conditions for a contraction. Inner-product spaces. Hilbert spaces. Cauchy–Schwarz' and Bessel's inequalities. Parseval's formula.

19. Matrices	133
Special matrices. Matrix operations. Inverse matrices and their properties. Trace. Rank. Matrix norms. Exponential matrices. Linear transformations. Generalized inverses. Moore–Penrose inverses. Partitioning matrices. Matrices with complex elements.	
20. Determinants	141
2×2 and 3×3 determinants. General determinants and their properties. Co-factors. Vandermonde and other special determinants. Minors. Cramer’s rule.	
21. Eigenvalues. Quadratic forms	145
Eigenvalues and eigenvectors. Diagonalization. Spectral theory. Jordan decomposition. Schur’s lemma. Cayley–Hamilton’s theorem. Quadratic forms and criteria for definiteness. Singular value decomposition. Simultaneous diagonalization. Definiteness of quadratic forms subject to linear constraints.	
22. Special matrices. Leontief systems	151
Properties of idempotent, orthogonal, and permutation matrices. Nonnegative matrices. Frobenius roots. Decomposable matrices. Dominant diagonal matrices. Leontief systems. Hawkins–Simon conditions.	
23. Kronecker products and the vec operator. Differentiation of vectors and matrices	155
Definition and properties of Kronecker products. The vec operator and its properties. Differentiation of vectors and matrices with respect to elements, vectors, and matrices.	
24. Comparative statics	159
Equilibrium conditions. Reciprocity relations. Monotone comparative statics. Sublattices of \mathbb{R}^n . Supermodularity. Increasing differences.	
25. Properties of cost and profit functions	163
Cost functions. Conditional factor demand functions. Shephard’s lemma. Profit functions. Factor demand functions. Supply functions. Hotelling’s lemma. Puu’s equation. Elasticities of substitution. Allen–Uzawa’s and Morishima’s elasticities of substitution. Cobb–Douglas and CES functions. Law of the minimum, Diewert, and translog cost functions.	
26. Consumer theory	169
Preference relations. Utility functions. Utility maximization. Indirect utility functions. Consumer demand functions. Roy’s identity. Expenditure functions. Hicksian demand functions. Cournot, Engel, and Slutsky elasticities. The Slutsky equation. Equivalent and compensating variations. LES (Stone–Geary), AIDS, and translog indirect utility functions. Laspeyres, Paasche, and general price indices. Fisher’s ideal index.	

-
- 27. Topics from trade theory** 175
 2×2 factor model. No factor intensity reversal. Stolper–Samuelson’s theorem. Heckscher–Ohlin–Samuelson’s model. Heckscher–Ohlin’s theorem.
- 28. Topics from finance and growth theory** 177
Compound interest. Effective rate of interest. Present value calculations. Internal rate of return. Norstrøm’s rule. Continuous compounding. Solow’s growth model. Ramsey’s growth model.
- 29. Risk and risk aversion theory** 181
Absolute and relative risk aversion. Arrow–Pratt risk premium. Stochastic dominance of first and second degree. Hadar–Russell’s theorem. Rothschild–Stiglitz’s theorem.
- 30. Finance and stochastic calculus** 183
Capital asset pricing model. The single consumption β asset pricing equation. The Black–Scholes option pricing model. Sensitivity results. A generalized Black–Scholes model. Put–call parity. Correspondence between American put and call options. American perpetual put options. Stochastic integrals. Itô’s formulas. A stochastic control problem. Hamilton–Jacobi–Bellman’s equation.
- 31. Non-cooperative game theory** 187
An n -person game in strategic form. Nash equilibrium. Mixed strategies. Strictly dominated strategies. Two-person games. Zero-sum games. Symmetric games. Saddle point property of the Nash equilibrium. The classical minimax theorem for two-person zero-sum games. Exchangeability property. Evolutionary game theory. Games of incomplete information. Dominant strategies and Bayesian Nash equilibrium. Pure strategy Bayesian Nash equilibrium.
- 32. Combinatorics** 191
Combinatorial results. Inclusion–exclusion principle. Pigeonhole principle.
- 33. Probability and statistics** 193
Axioms for probability. Rules for calculating probabilities. Conditional probability. Stochastic independence. Bayes’s rule. One-dimensional random variables. Probability density functions. Cumulative distribution functions. Expectation. Mean. Variance. Standard deviation. Central moments. Coefficients of skewness and kurtosis. Chebyshev’s and Jensen’s inequalities. Moment generating and characteristic functions. Two-dimensional random variables and distributions. Covariance. Cauchy–Schwarz’s inequality. Correlation coefficient. Marginal and conditional density functions. Stochastic independence. Conditional expectation and variance. Iterated expectations. Transformations of stochastic variables. Estimators. Bias. Mean square error. Probability limits. Convergence in

quadratic mean. Slutsky's theorem. Limiting distribution. Consistency. Testing. Power of a test. Type I and type II errors. Level of significance. Significance probability (P -value). Weak and strong law of large numbers. Central limit theorem.

34. Probability distributions	201
Beta, binomial, binormal, chi-square, exponential, extreme value (Gumbel), F -, gamma, geometric, hypergeometric, Laplace, logistic, lognormal, multinomial, multivariate normal, negative binomial, normal, Pareto, Poisson, Student's t -, uniform, and Weibull distributions.	
35. Method of least squares	207
Ordinary least squares. Linear regression. Multiple regression.	
References	211
Index	215

Chapter 1

Set Theory. Relations. Functions

1.1 $x \in A, \quad x \notin B$

The element x belongs to the set A , but x does not belong to the set B .

1.2 $A \subset B \iff$ Each element of A is also an element of B .

A is a *subset* of B . Often written $A \subseteq B$.

If S is a set, then the set of all elements x in S with property $\varphi(x)$ is written

1.3 $A = \{x \in S : \varphi(x)\}$

If the set S is understood from the context, one often uses a simpler notation:

$A = \{x : \varphi(x)\}$

General notation for the specification of a set. For example, $\{x \in \mathbb{R} : -2 \leq x \leq 4\} = [-2, 4]$.

The following logical operators are often used when P and Q are statements:

- $P \wedge Q$ means “ P and Q ”
- $P \vee Q$ means “ P or Q ”
- 1.4 • $P \Rightarrow Q$ means “if P then Q ” (or “ P only if Q ”, or “ P implies Q ”)
- $P \Leftarrow Q$ means “if Q then P ”
- $P \Leftrightarrow Q$ means “ P if and only if Q ”
- $\neg P$ means “not P ”

Logical operators. (Note that “ P or Q ” means “either P or Q or both”.)

1.5

P	Q	$\neg P$	$P \wedge Q$	$P \vee Q$	$P \Rightarrow Q$	$P \Leftrightarrow Q$
T	T	F	T	T	T	T
T	F	F	F	T	F	F
F	T	T	F	T	T	F
F	F	T	F	F	T	T

Truth table for logical operators. Here T means “true” and F means “false”.

- P is a *sufficient condition* for Q : $P \Rightarrow Q$
- Q is a *necessary condition* for P : $P \Rightarrow Q$
- 1.6 • P is a *necessary and sufficient condition* for Q : $P \Leftrightarrow Q$

Frequently used terminology.

$$A \cup B = \{x : x \in A \vee x \in B\} \text{ (} A \text{ union } B\text{)}$$

$$A \cap B = \{x : x \in A \wedge x \in B\} \text{ (} A \text{ intersection } B\text{)}$$

$$A \setminus B = \{x : x \in A \wedge x \notin B\} \text{ (} A \text{ minus } B\text{)}$$

$$1.7 \quad A \Delta B = (A \setminus B) \cup (B \setminus A) \text{ (symmetric difference)}$$

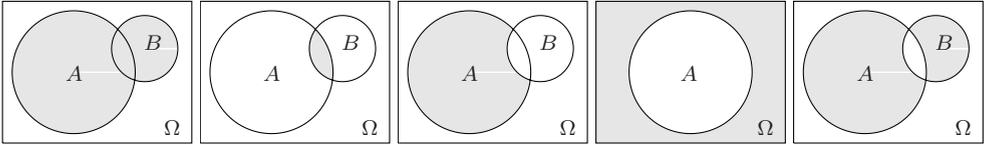

If all the sets in question are contained in some “universal” set Ω , one often writes $\Omega \setminus A$ as

$$A^c = \{x : x \notin A\} \text{ (the complement of } A\text{)}$$

Basic set operations.

$A \setminus B$ is called the *difference* between A and B .

An alternative symbol for A^c is $\complement A$.

$A \cup B$

$A \cap B$

$A \setminus B$

A^c

$A \Delta B$

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

$$A \Delta B = (A \cup B) \setminus (A \cap B)$$

$$1.8 \quad (A \Delta B) \Delta C = A \Delta (B \Delta C)$$

$$A \setminus (B \cup C) = (A \setminus B) \cap (A \setminus C)$$

$$A \setminus (B \cap C) = (A \setminus B) \cup (A \setminus C)$$

$$A \cup B)^c = A^c \cap B^c$$

$$(A \cap B)^c = A^c \cup B^c$$

Important identities

in set theory. The last four identities are called *De Morgan's laws*.

$$1.9 \quad A_1 \times A_2 \times \cdots \times A_n =$$

$$\{(a_1, a_2, \dots, a_n) : a_i \in A_i \text{ for } i = 1, 2, \dots, n\}$$

The *Cartesian product* of the sets A_1, A_2, \dots, A_n .

$$1.10 \quad R \subset A \times B$$

Any subset R of $A \times B$ is called a *relation* from the set A into the set B .

$$1.11 \quad xRy \iff (x, y) \in R$$

$$x \not R y \iff (x, y) \notin R$$

Alternative notations

for a relation and its negation. We say that x is in R -relation to y if $(x, y) \in R$.

$$\bullet \text{ dom}(R) = \{a \in A : (a, b) \in R \text{ for some } b \text{ in } B\}$$

$$= \{a \in A : aRb \text{ for some } b \text{ in } B\}$$

1.12

$$\bullet \text{ range}(R) = \{b \in B : (a, b) \in R \text{ for some } a \text{ in } A\}$$

$$= \{b \in B : aRb \text{ for some } a \text{ in } A\}$$

The *domain* and *range* of a relation.

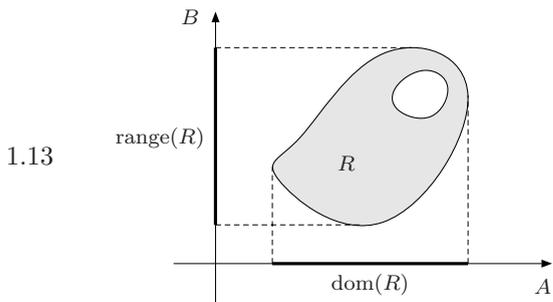

Illustration of the domain and range of a relation, R , as defined in (1.12). The shaded set is the *graph* of the relation.

1.14 $R^{-1} = \{(b, a) \in B \times A : (a, b) \in R\}$

The *inverse* relation of a relation R from A to B . R^{-1} is a relation from B to A .

1.15 Let R be a relation from A to B and S a relation from B to C . Then we define the *composition* $S \circ R$ of R and S as the set of all (a, c) in $A \times C$ such that there is an element b in B with aRb and bSc . $S \circ R$ is a relation from A to C .

$S \circ R$ is the composition of the relations R and S .

A relation R from A to A itself is called a *binary relation* in A . A binary relation R in A is said to be

- 1.16
- *reflexive* if aRa for every a in A ;
 - *irreflexive* if $a \not R a$ for every a in A ;
 - *complete* if aRb or bRa for every a and b in A with $a \neq b$;
 - *transitive* if aRb and bRc imply aRc ;
 - *symmetric* if aRb implies bRa ;
 - *antisymmetric* if aRb and bRa implies $a = b$;
 - *asymmetric* if aRb implies $b \not R a$.

Special relations.

A binary relation R in A is called

- 1.17
- a *preordering* (or a *quasi-ordering*) if it is reflexive and transitive;
 - a *weak ordering* if it is transitive and complete;
 - a *partial ordering* if it is reflexive, transitive, and antisymmetric;
 - a *linear* (or *total*) *ordering* if it is reflexive, transitive, antisymmetric, and complete;
 - an *equivalence relation* if it is reflexive, transitive, and symmetric.

Special relations. (The terminology is not universal.) Note that a linear ordering is the same as a partial ordering that is also complete.

Order relations are often denoted by symbols like \preceq , \leq , \ll , etc. The inverse relations are then denoted by \succ , \geq , \gg , etc.

- 1.18
- The relation $=$ between real numbers is an equivalence relation.
 - The relation \leq between real numbers is a linear ordering.
 - The relation $<$ between real numbers is a weak ordering that is also irreflexive and asymmetric.
 - The relation \subset between subsets of a given set is a partial ordering.
 - The relation $\mathbf{x} \preceq \mathbf{y}$ (\mathbf{y} is *at least as good as* \mathbf{x}) in a set of commodity vectors is usually assumed to be a complete preordering.
 - The relation $\mathbf{x} \prec \mathbf{y}$ (\mathbf{y} is *(strictly) preferred to* \mathbf{x}) in a set of commodity vectors is usually assumed to be irreflexive, transitive, (and consequently asymmetric).
 - The relation $\mathbf{x} \sim \mathbf{y}$ (\mathbf{x} is *indifferent to* \mathbf{y}) in a set of commodity vectors is usually assumed to be an equivalence relation.

Examples of relations.
For the relations $\mathbf{x} \preceq \mathbf{y}$, $\mathbf{x} \prec \mathbf{y}$, and $\mathbf{x} \sim \mathbf{y}$, see Chap. 26.

- 1.19
- Let \preceq be a preordering in a set A . An element g in A is called a *greatest element* for \preceq in A if $x \preceq g$ for every x in A . An element m in A is called a *maximal element* for \preceq in A if $x \in A$ and $m \preceq x$ implies $x \preceq m$. A *least element* and a *minimal element* for \preceq are a greatest element and a maximal element, respectively, for the inverse relation \succcurlyeq of \preceq .

The definition of a greatest element, a maximal element, a least element, and a minimal element of a preordered set.

- 1.20
- If \preceq is a preordering in A and M is a subset of A , an element b in A is called an *upper bound* for M (w.r.t. \preceq) if $x \preceq b$ for every x in M . A *lower bound* for M is an element a in A such that $a \preceq x$ for all x in M .

Definition of upper and lower bounds.

- 1.21
- If \preceq is a preordering in a nonempty set A and if each linearly ordered subset M of A has an upper bound in A , then there exists a maximal element for \preceq in A .

Zorn's lemma. (Usually stated for partial orderings, but also valid for preorderings.)

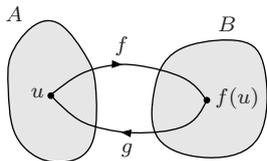

- 1.22 A relation R from A to B is called a *function* or *mapping* if for every a in A , there is a unique b in B with aRb . If the function is denoted by f , then we write $f(a) = b$ for afb , and the *graph* of f is defined as:
- $$\text{graph}(f) = \{(a, b) \in A \times B : f(a) = b\}.$$
- The definition of a function and its graph.
- 1.23 A function f from A to B ($f : A \rightarrow B$) is called
- *injective* (or *one-to-one*) if $f(x) = f(y)$ implies $x = y$;
 - *surjective* (or *onto*) if $\text{range}(f) = B$;
 - *bijective* if it is injective and surjective.
- Important concepts related to functions.
- 1.24 If $f : A \rightarrow B$ is bijective (i.e. both one-to-one and onto), it has an *inverse function* $g : B \rightarrow A$, defined by $g(f(u)) = u$ for all u in A .
- Characterization of inverse functions. The inverse function of f is often denoted by f^{-1} .
- 1.25 

Illustration of the concept of an inverse function.

1.26 If f is a function from A to B , and $C \subset A$, $D \subset B$, then we use the notation

 - $f(C) = \{f(x) : x \in C\}$
 - $f^{-1}(D) = \{x \in A : f(x) \in D\}$

$f(C)$ is called the *image* of A under f , and $f^{-1}(D)$ is called the *inverse image* of D .

1.27 If f is a function from A to B , and $S \subset A$, $T \subset A$, $U \subset B$, $V \subset B$, then

 - $f(S \cup T) = f(S) \cup f(T)$
 - $f(S \cap T) \subset f(S) \cap f(T)$
 - $f^{-1}(U \cup V) = f^{-1}(U) \cup f^{-1}(V)$
 - $f^{-1}(U \cap V) = f^{-1}(U) \cap f^{-1}(V)$
 - $f^{-1}(U \setminus V) = f^{-1}(U) \setminus f^{-1}(V)$

Important facts. The inclusion \subset in $f(S \cap T) \subset f(S) \cap f(T)$ cannot be replaced by $=$.

1.28 Let $\mathbb{N} = \{1, 2, 3, \dots\}$ be the set of natural numbers, and let $\mathbb{N}_n = \{1, 2, 3, \dots, n\}$. Then:

 - A set A is *finite* if it is empty, or if there exists a one-to-one function from A onto \mathbb{N}_n for some natural number n .
 - A set A is *countably infinite* if there exists a one-to-one function of A onto \mathbb{N} .

A set that is either finite or countably infinite, is often called *countable*. The set of rational numbers is countably infinite, while the set of real numbers is not countable.

Suppose that $A(n)$ is a statement for every natural number n and that

- 1.29
- $A(1)$ is true,
 - if the induction hypothesis $A(k)$ is true, then $A(k + 1)$ is true for each natural number k .

Then $A(n)$ is true for all natural numbers n .

The principle of mathematical induction.

Chapter 2

Equations. Functions of one variable. Complex numbers

$$2.1 \quad ax^2 + bx + c = 0 \iff x_{1,2} = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

The roots of the general *quadratic* equation. They are real provided $b^2 \geq 4ac$ (assuming that a , b , and c are real).

2.2 If x_1 and x_2 are the roots of $x^2 + px + q = 0$, then

$$x_1 + x_2 = -p, \quad x_1 x_2 = q$$

Viète's rule.

$$2.3 \quad ax^3 + bx^2 + cx + d = 0$$

The general *cubic* equation.

$$2.4 \quad x^3 + px + q = 0$$

(2.3) reduces to the form (2.4) if x in (2.3) is replaced by $x - b/3a$.

$x^3 + px + q = 0$ with $\Delta = 4p^3 + 27q^2$ has

- 2.5
- three different real roots if $\Delta < 0$;
 - three real roots, at least two of which are equal, if $\Delta = 0$;
 - one real and two complex roots if $\Delta > 0$.

Classification of the roots of (2.4) (assuming that p and q are real).

The solutions of $x^3 + px + q = 0$ are

$x_1 = u + v$, $x_2 = \omega u + \omega^2 v$, and $x_3 = \omega^2 u + \omega v$, where $\omega = -\frac{1}{2} + \frac{i}{2}\sqrt{3}$, and

$$2.6 \quad u = \sqrt[3]{-\frac{q}{2} + \frac{1}{2}\sqrt{\frac{4p^3 + 27q^2}{27}}}$$
$$v = \sqrt[3]{-\frac{q}{2} - \frac{1}{2}\sqrt{\frac{4p^3 + 27q^2}{27}}}$$

Cardano's formulas for the roots of a cubic equation. i is the imaginary unit (see (2.75)) and ω is a complex third root of 1 (see (2.88)). (If complex numbers become involved, the cube roots must be chosen so that $3uv = -p$. Don't try to use these formulas unless you have to!)

If $x_1, x_2,$ and x_3 are the roots of the equation $x^3 + px^2 + qx + r = 0$, then

$$\begin{aligned} 2.7 \quad & x_1 + x_2 + x_3 = -p \\ & x_1x_2 + x_1x_3 + x_2x_3 = q \\ & x_1x_2x_3 = -r \end{aligned}$$

Useful relations.

$$2.8 \quad P(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0$$

A *polynomial* of degree n . ($a_n \neq 0$.)

For the polynomial $P(x)$ in (2.8) there exist constants x_1, x_2, \dots, x_n (real or complex) such that

$$2.9 \quad P(x) = a_n(x - x_1) \cdots (x - x_n)$$

The *fundamental theorem of algebra*. x_1, \dots, x_n are called *zeros* of $P(x)$ and *roots* of $P(x) = 0$.

$$x_1 + x_2 + \cdots + x_n = -\frac{a_{n-1}}{a_n}$$

$$2.10 \quad \begin{aligned} x_1x_2 + x_1x_3 + \cdots + x_{n-1}x_n &= \sum_{i < j} x_i x_j = \frac{a_{n-2}}{a_n} \\ x_1x_2 \cdots x_n &= (-1)^n \frac{a_0}{a_n} \end{aligned}$$

Relations between the roots and the coefficients of $P(x) = 0$, where $P(x)$ is defined in (2.8). (Generalizes (2.2) and (2.7).)

If a_{n-1}, \dots, a_1, a_0 are all integers, then any integer root of the equation

$$2.11 \quad x^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0 = 0$$

must divide a_0 .

Any integer solutions of $x^3 + 6x^2 - x - 6 = 0$ must divide -6 . (In this case the roots are ± 1 and -6 .)

Let k be the number of changes of sign in the sequence of coefficients $a_n, a_{n-1}, \dots, a_1, a_0$ in (2.8). The number of positive real roots of $P(x) = 0$, counting the multiplicities of the roots, is k or k minus a positive even number. If $k = 1$, the equation has exactly one positive real root.

2.12

Descartes's rule of signs.

The graph of the equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

is

- 2.13
- an ellipse, a point or empty if $4AC > B^2$;
 - a parabola, a line, two parallel lines, or empty if $4AC = B^2$;
 - a hyperbola or two intersecting lines if $4AC < B^2$.

Classification of *conics*. A, B, C not all 0.

$$2.14 \quad x = x' \cos \theta - y' \sin \theta, \quad y = x' \sin \theta + y' \cos \theta$$

with $\cot 2\theta = (A - C)/B$

Transforms the equation in (2.13) into a quadratic equation in x' and y' , where the coefficient of $x'y'$ is 0.

$$2.15 \quad d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

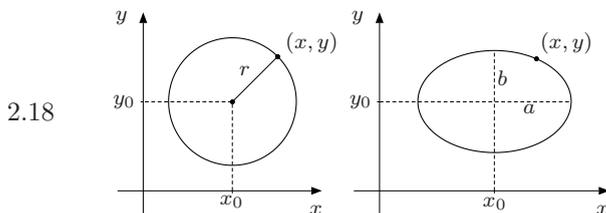

The (Euclidean) *distance* between the points (x_1, y_1) and (x_2, y_2) .

$$2.16 \quad (x - x_0)^2 + (y - y_0)^2 = r^2$$

Circle with center at (x_0, y_0) and radius r .

$$2.17 \quad \frac{(x - x_0)^2}{a^2} + \frac{(y - y_0)^2}{b^2} = 1$$

Ellipse with center at (x_0, y_0) and axes parallel to the coordinate axes.

Graphs of (2.16) and (2.17).

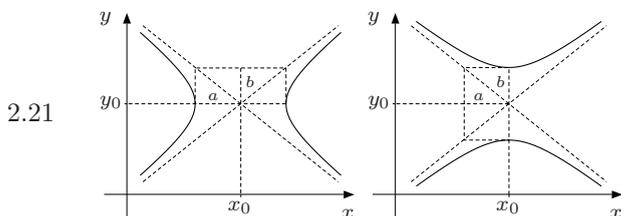

$$2.19 \quad \frac{(x - x_0)^2}{a^2} - \frac{(y - y_0)^2}{b^2} = \pm 1$$

Hyperbola with center at (x_0, y_0) and axes parallel to the coordinate axes.

$$2.20 \quad \text{Asymptotes for (2.19):}$$

$$y - y_0 = \pm \frac{b}{a}(x - x_0)$$

Formulas for asymptotes of the hyperbolas in (2.19).

Hyperbolas with asymptotes, illustrating (2.19) and (2.20), corresponding to + and - in (2.19), respectively. The two hyperbolas have the same asymptotes.

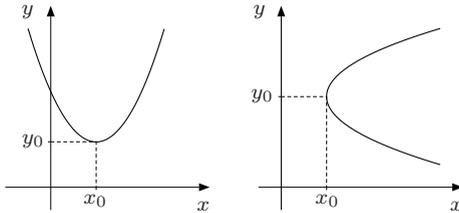

$$2.22 \quad y - y_0 = a(x - x_0)^2, \quad a \neq 0$$

Parabola with vertex (x_0, y_0) and axis parallel to the y -axis.

$$2.23 \quad x - x_0 = a(y - y_0)^2, \quad a \neq 0$$

Parabola with vertex (x_0, y_0) and axis parallel to the x -axis.

2.24

Parabolas illustrating (2.22) and (2.23) with $a > 0$.

A function f is

- *increasing* if

$$x_1 < x_2 \Rightarrow f(x_1) \leq f(x_2)$$
- *strictly increasing* if

$$x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$$
- *decreasing* if

$$x_1 < x_2 \Rightarrow f(x_1) \geq f(x_2)$$

2.25

- *strictly decreasing* if

$$x_1 < x_2 \Rightarrow f(x_1) > f(x_2)$$
- *even* if $f(x) = f(-x)$ for all x
- *odd* if $f(x) = -f(-x)$ for all x
- *symmetric about the line $x = a$* if

$$f(a + x) = f(a - x)$$
 for all x
- *symmetric about the point $(a, 0)$* if

$$f(a - x) = -f(a + x)$$
 for all x
- *periodic* (with period k) if there exists a number $k > 0$ such that

$$f(x + k) = f(x)$$
 for all x

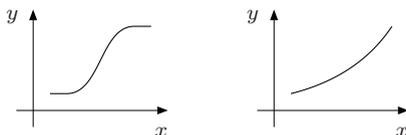

Properties of functions.

2.26

- If $y = f(x)$ is replaced by $y = f(x) + c$, the graph is moved upwards by c units if $c > 0$ (downwards if c is negative).
- If $y = f(x)$ is replaced by $y = f(x + c)$, the graph is moved c units to the left if $c > 0$ (to the right if c is negative).
- If $y = f(x)$ is replaced by $y = cf(x)$, the graph is stretched vertically if $c > 0$ (stretched vertically and reflected about the x -axis if c is negative).
- If $y = f(x)$ is replaced by $y = f(-x)$, the graph is reflected about the y -axis.

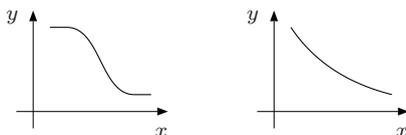

Shifting the graph of $y = f(x)$.

2.27

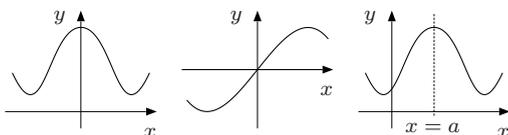

Graphs of increasing and strictly increasing functions.

2.28

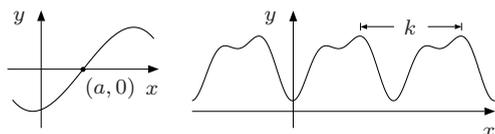

Graphs of decreasing and strictly decreasing functions.

2.29

Graphs of even and odd functions, and of a function symmetric about $x = a$.

2.30

Graphs of a function symmetric about the point $(a, 0)$ and of a function periodic with period k .

$y = ax + b$ is a *nonvertical asymptote* for the curve $y = f(x)$ if

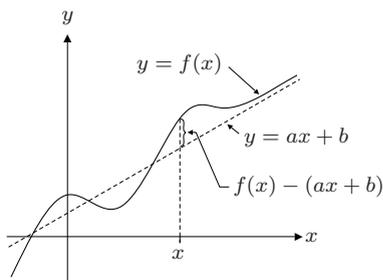

$$2.31 \quad \lim_{x \rightarrow \infty} (f(x) - (ax + b)) = 0$$

or

$$\lim_{x \rightarrow -\infty} (f(x) - (ax + b)) = 0$$

Definition of a nonvertical asymptote.

2.32

$y = ax + b$ is an asymptote for the curve $y = f(x)$.

How to find a nonvertical asymptote for the curve $y = f(x)$ as $x \rightarrow \infty$:

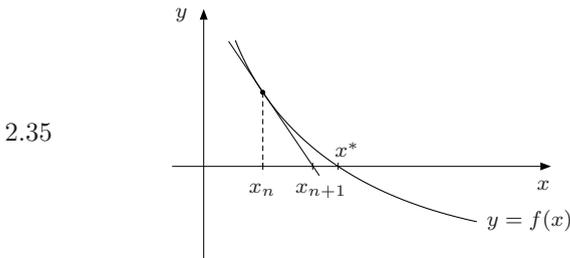

- 2.33
- Examine $\lim_{x \rightarrow \infty} (f(x)/x)$. If the limit does not exist, there is no asymptote as $x \rightarrow \infty$.
 - If $\lim_{x \rightarrow \infty} (f(x)/x) = a$, examine the limit $\lim_{x \rightarrow \infty} (f(x) - ax)$. If this limit does not exist, the curve has no asymptote as $x \rightarrow \infty$.
 - If $\lim_{x \rightarrow \infty} (f(x) - ax) = b$, then $y = ax + b$ is an *asymptote* for the curve $y = f(x)$ as $x \rightarrow \infty$.

To find an approximate root of $f(x) = 0$, define x_n for $n = 1, 2, \dots$, by

2.34

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

If x_0 is close to an actual root x^* , the sequence $\{x_n\}$ will usually converge rapidly to that root.

Suppose in (2.34) that $f(x^*) = 0$, $f'(x^*) \neq 0$, and that $f''(x^*)$ exists and is continuous in a neighbourhood of x^* . Then there exists a $\delta > 0$ such that the sequence $\{x_n\}$ in (2.34) converges to x^* when $x_0 \in (x^* - \delta, x^* + \delta)$.

2.36

Suppose in (2.34) that f is twice differentiable with $f(x^*) = 0$ and $f'(x^*) \neq 0$. Suppose further that there exist a $K > 0$ and a $\delta > 0$ such that for all x in $(x^* - \delta, x^* + \delta)$,

2.37

$$\frac{|f(x)f''(x)|}{f'(x)^2} \leq K|x - x^*| < 1$$

Then if $x_0 \in (x^* - \delta, x^* + \delta)$, the sequence $\{x_n\}$ in (2.34) converges to x^* and

$$|x_n - x^*| \leq (\delta K)^{2^n} / K$$

Method for finding nonvertical asymptotes for a curve $y = f(x)$ as $x \rightarrow \infty$. Replacing $x \rightarrow \infty$ by $x \rightarrow -\infty$ gives a method for finding nonvertical asymptotes as $x \rightarrow -\infty$.

Newton's approximation method. (A rule of thumb says that, to obtain an approximation that is correct to n decimal places, use Newton's method until it gives the same n decimal places twice in a row.)

Illustration of Newton's approximation method. The tangent to the graph of f at $(x_n, f(x_n))$ intersects the x -axis at $x = x_{n+1}$.

Sufficient conditions for convergence of Newton's method.

A precise estimation of the accuracy of Newton's method.

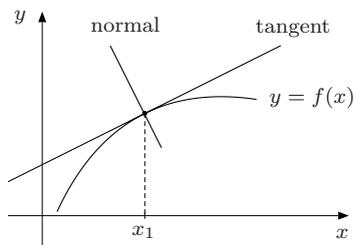

$$2.38 \quad y - f(x_1) = f'(x_1)(x - x_1)$$

The equation for the *tangent* to $y = f(x)$ at $(x_1, f(x_1))$.

$$2.39 \quad y - f(x_1) = -\frac{1}{f'(x_1)}(x - x_1)$$

The equation for the *normal* to $y = f(x)$ at $(x_1, f(x_1))$.

2.40

The tangent and the normal to $y = f(x)$ at $(x_1, f(x_1))$.

$$2.41 \quad \begin{array}{ll} \text{(i)} & a^r \cdot a^s = a^{r+s} \\ \text{(ii)} & (a^r)^s = a^{rs} \\ \text{(iii)} & (ab)^r = a^r b^r \\ \text{(iv)} & a^r / a^s = a^{r-s} \\ \text{(v)} & \left(\frac{a}{b}\right)^r = \frac{a^r}{b^r} \\ \text{(vi)} & a^{-r} = \frac{1}{a^r} \end{array}$$

Rules for powers. (r and s are arbitrary real numbers, a and b are positive real numbers.)

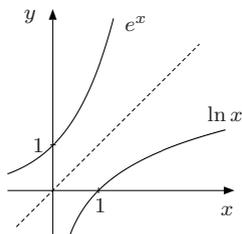

$$2.42 \quad \begin{array}{l} \bullet \quad e = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = 2.718281828459\dots \\ \bullet \quad e^x = \lim_{n \rightarrow \infty} \left(1 + \frac{x}{n}\right)^n \\ \bullet \quad \lim_{n \rightarrow \infty} a_n = a \Rightarrow \lim_{n \rightarrow \infty} \left(1 + \frac{a_n}{n}\right)^n = e^a \end{array}$$

Important definitions and results. See (8.23) for another formula for e^x .

$$2.43 \quad e^{\ln x} = x$$

Definition of the natural logarithm.

2.44

The graphs of $y = e^x$ and $y = \ln x$ are symmetric about the line $y = x$.

$$2.45 \quad \ln(xy) = \ln x + \ln y; \quad \ln \frac{x}{y} = \ln x - \ln y$$

$$\ln x^p = p \ln x; \quad \ln \frac{1}{x} = -\ln x$$

Rules for the natural logarithm function. (x and y are positive.)

$$2.46 \quad a^{\log_a x} = x \quad (a > 0, a \neq 1)$$

Definition of the *logarithm* to the base a .

$$2.47 \quad \log_a x = \frac{\ln x}{\ln a}; \quad \log_a b \cdot \log_b a = 1$$

$$\log_e x = \ln x; \quad \log_{10} x = \log_{10} e \cdot \ln x$$

Logarithms with different bases.

$$\log_a(xy) = \log_a x + \log_a y$$

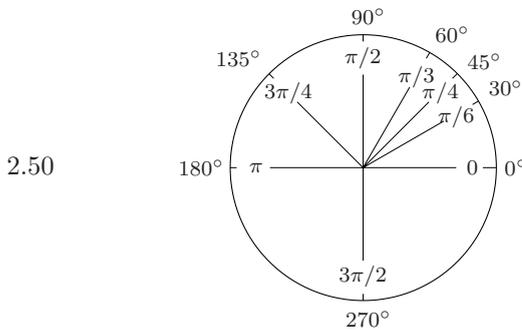

$$2.48 \quad \log_a \frac{x}{y} = \log_a x - \log_a y$$

$$\log_a x^p = p \log_a x, \quad \log_a \frac{1}{x} = -\log_a x$$

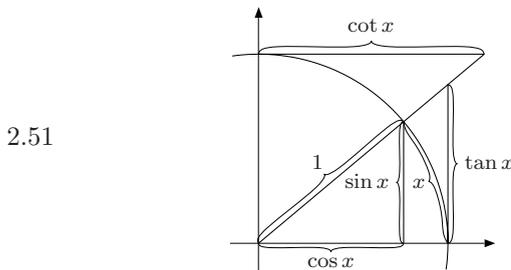

Rules for logarithms.
(x and y are positive.)

$$2.49 \quad 1^\circ = \frac{\pi}{180} \text{ rad}, \quad 1 \text{ rad} = \left(\frac{180}{\pi}\right)^\circ$$

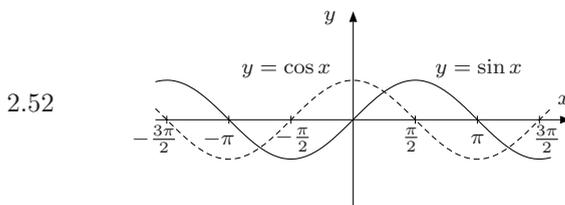

Relationship between degrees and radians (rad).

Relations between degrees and radians.

Definitions of the basic *trigonometric* functions.
 x is the length of the arc, and also the radian measure of the angle.

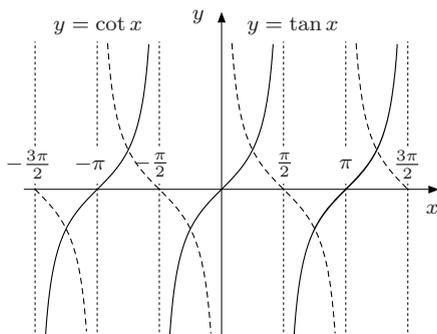

The graphs of $y = \sin x$ (—) and $y = \cos x$ (---).
The functions \sin and \cos are periodic with period 2π :
 $\sin(x + 2\pi) = \sin x$,
 $\cos(x + 2\pi) = \cos x$.

$$2.53 \quad \tan x = \frac{\sin x}{\cos x}, \quad \cot x = \frac{\cos x}{\sin x} = \frac{1}{\tan x}$$

Definition of the *tangent* and *cotangent* functions.

2.54

The graphs of $y = \tan x$ (—) and $y = \cot x$ (---). The functions \tan and \cot are periodic with period π :
 $\tan(x + \pi) = \tan x$,
 $\cot(x + \pi) = \cot x$.

2.55

x	0	$\frac{\pi}{6} = 30^\circ$	$\frac{\pi}{4} = 45^\circ$	$\frac{\pi}{3} = 60^\circ$	$\frac{\pi}{2} = 90^\circ$
$\sin x$	0	$\frac{1}{2}$	$\frac{1}{2}\sqrt{2}$	$\frac{1}{2}\sqrt{3}$	1
$\cos x$	1	$\frac{1}{2}\sqrt{3}$	$\frac{1}{2}\sqrt{2}$	$\frac{1}{2}$	0
$\tan x$	0	$\frac{1}{3}\sqrt{3}$	1	$\sqrt{3}$	*

$$2.57 \quad \lim_{x \rightarrow 0} \frac{\sin ax}{x} = a$$

An important limit.

$$2.58 \quad \sin^2 x + \cos^2 x = 1$$

Trigonometric formulas. (For series expansions of trigonometric functions, see Chapter 8.)

$$2.59 \quad \tan^2 x = \frac{1}{\cos^2 x} - 1, \quad \cot^2 x = \frac{1}{\sin^2 x} - 1$$

$$2.60 \quad \begin{aligned} \cos(x + y) &= \cos x \cos y - \sin x \sin y \\ \cos(x - y) &= \cos x \cos y + \sin x \sin y \\ \sin(x + y) &= \sin x \cos y + \cos x \sin y \\ \sin(x - y) &= \sin x \cos y - \cos x \sin y \end{aligned}$$

$$2.61 \quad \tan(x+y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}$$

$$\tan(x-y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}$$

Trigonometric formulas.

$$2.62 \quad \cos 2x = 2 \cos^2 x - 1 = 1 - 2 \sin^2 x$$

$$\sin 2x = 2 \sin x \cos x$$

$$2.63 \quad \sin^2 \frac{x}{2} = \frac{1 - \cos x}{2}, \quad \cos^2 \frac{x}{2} = \frac{1 + \cos x}{2}$$

$$2.64 \quad \cos x + \cos y = 2 \cos \frac{x+y}{2} \cos \frac{x-y}{2}$$

$$\cos x - \cos y = -2 \sin \frac{x+y}{2} \sin \frac{x-y}{2}$$

$$2.65 \quad \sin x + \sin y = 2 \sin \frac{x+y}{2} \cos \frac{x-y}{2}$$

$$\sin x - \sin y = 2 \cos \frac{x+y}{2} \sin \frac{x-y}{2}$$

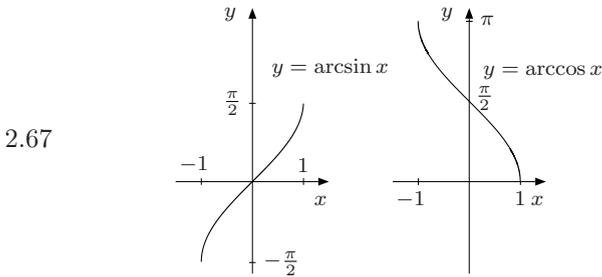

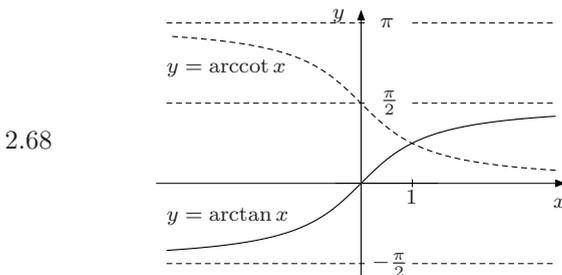

$$2.66 \quad y = \arcsin x \Leftrightarrow x = \sin y, \quad x \in [-1, 1], \quad y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

$$y = \arccos x \Leftrightarrow x = \cos y, \quad x \in [-1, 1], \quad y \in [0, \pi]$$

$$y = \arctan x \Leftrightarrow x = \tan y, \quad x \in \mathbb{R}, \quad y \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

$$y = \operatorname{arccot} x \Leftrightarrow x = \cot y, \quad x \in \mathbb{R}, \quad y \in (0, \pi)$$

Definitions of the inverse trigonometric functions.

Graphs of the inverse trigonometric functions $y = \arcsin x$ and $y = \arccos x$.Graphs of the inverse trigonometric functions $y = \arctan x$ and $y = \operatorname{arccot} x$.

$$2.69 \quad \arcsin x = \sin^{-1} x, \quad \arccos x = \cos^{-1} x \\ \arctan x = \tan^{-1} x, \quad \operatorname{arccot} x = \cot^{-1} x$$

Alternative notation for the inverse trigonometric functions.

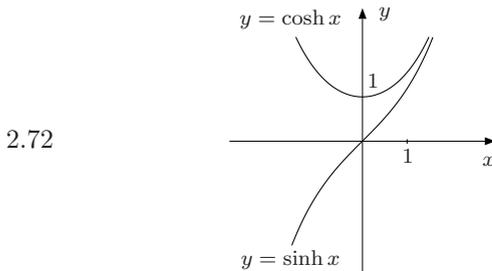

$$\arcsin(-x) = -\arcsin x \\ \arccos(-x) = \pi - \arccos x \\ \arctan(-x) = \arctan x \\ \operatorname{arccot}(-x) = \pi - \operatorname{arccot} x$$

$$2.70 \quad \arcsin x + \arccos x = \frac{\pi}{2} \\ \arctan x + \operatorname{arccot} x = \frac{\pi}{2} \\ \arctan \frac{1}{x} = \frac{\pi}{2} - \arctan x, \quad x > 0 \\ \arctan \frac{1}{x} = -\frac{\pi}{2} - \arctan x, \quad x < 0$$

Properties of the inverse trigonometric functions.

$$2.71 \quad \sinh x = \frac{e^x - e^{-x}}{2}, \quad \cosh x = \frac{e^x + e^{-x}}{2}$$

Hyperbolic sine and cosine.

Graphs of the hyperbolic functions $y = \sinh x$ and $y = \cosh x$.

$$2.73 \quad \cosh^2 x - \sinh^2 x = 1 \\ \cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y \\ \cosh 2x = \cosh^2 x + \sinh^2 x \\ \sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y \\ \sinh 2x = 2 \sinh x \cosh x$$

Properties of hyperbolic functions.

$$2.74 \quad y = \operatorname{arsinh} x \iff x = \sinh y \\ y = \operatorname{arcosh} x, \quad x \geq 1 \iff x = \cosh y, \quad y \geq 0 \\ \operatorname{arsinh} x = \ln(x + \sqrt{x^2 + 1}) \\ \operatorname{arcosh} x = \ln(x + \sqrt{x^2 - 1}), \quad x \geq 1$$

Definition of the inverse hyperbolic functions.

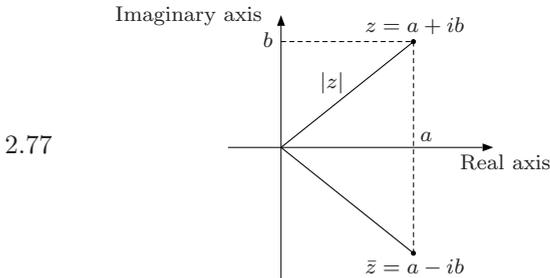

Complex numbers

$$2.75 \quad z = a + ib, \quad \bar{z} = a - ib$$

A *complex number* and its *conjugate*. $a, b \in \mathbb{R}$, and $i^2 = -1$. i is called the *imaginary unit*.

$$2.76 \quad |z| = \sqrt{a^2 + b^2}, \quad \operatorname{Re}(z) = a, \quad \operatorname{Im}(z) = b$$

$|z|$ is the *modulus* of $z = a + ib$. $\operatorname{Re}(z)$ and $\operatorname{Im}(z)$ are the *real* and *imaginary parts* of z .

Geometric representation of a complex number and its conjugate.

$$2.78 \quad \begin{aligned} &\bullet (a + ib) + (c + id) = (a + c) + i(b + d) \\ &\bullet (a + ib) - (c + id) = (a - c) + i(b - d) \\ &\bullet (a + ib)(c + id) = (ac - bd) + i(ad + bc) \\ &\bullet \frac{a + ib}{c + id} = \frac{1}{c^2 + d^2} ((ac + bd) + i(bc - ad)) \end{aligned}$$

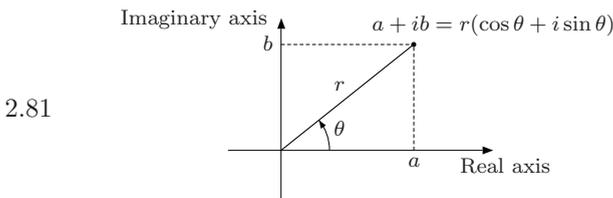

Addition, subtraction, multiplication, and division of complex numbers.

$$2.79 \quad \begin{aligned} |\bar{z}_1| &= |z_1|, \quad z_1 \bar{z}_1 = |z_1|^2, \quad \overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2, \\ |z_1 z_2| &= |z_1| |z_2|, \quad |z_1 + z_2| \leq |z_1| + |z_2| \end{aligned}$$

Basic rules. z_1 and z_2 are complex numbers.

$$2.80 \quad \begin{aligned} z = a + ib &= r(\cos \theta + i \sin \theta) = re^{i\theta}, \quad \text{where} \\ r = |z| &= \sqrt{a^2 + b^2}, \quad \cos \theta = \frac{a}{r}, \quad \sin \theta = \frac{b}{r} \end{aligned}$$

The *trigonometric* or *polar* form of a complex number. The angle θ is called the *argument* of z . See (2.84) for $e^{i\theta}$.

Geometric representation of the trigonometric form of a complex number.

- If $z_k = r_k(\cos \theta_k + i \sin \theta_k)$, $k = 1, 2$, then
- 2.82
$$z_1 z_2 = r_1 r_2 (\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2))$$

$$\frac{z_1}{z_2} = \frac{r_1}{r_2} (\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2))$$
- 2.83 $(\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$
- If $z = x + iy$, then
- 2.84
$$e^z = e^{x+iy} = e^x \cdot e^{iy} = e^x (\cos y + i \sin y)$$

 In particular,

$$e^{iy} = \cos y + i \sin y$$
- 2.85 $e^{\pi i} = -1$
- 2.86
$$e^{\bar{z}} = \overline{e^z}, \quad e^{z+2\pi i} = e^z, \quad e^{z_1+z_2} = e^{z_1} e^{z_2},$$

$$e^{z_1-z_2} = e^{z_1} / e^{z_2}$$
- 2.87
$$\cos z = \frac{e^{iz} + e^{-iz}}{2}, \quad \sin z = \frac{e^{iz} - e^{-iz}}{2i}$$
- If $a = r(\cos \theta + i \sin \theta) \neq 0$, then the equation
- 2.88
$$z^n = a$$

 has exactly n roots, namely

$$z_k = \sqrt[n]{r} \left(\cos \frac{\theta + 2k\pi}{n} + i \sin \frac{\theta + 2k\pi}{n} \right)$$

 for $k = 0, 1, \dots, n-1$.

Multiplication and division on trigonometric form.

De Moivre's formula,
 $n = 0, 1, \dots$

The *complex exponential function*.

A striking relationship.

Rules for the complex exponential function.

Euler's formulas.

n th roots of a complex number, $n = 1, 2, \dots$

References

Most of these formulas can be found in any calculus text, e.g. Edwards and Penney (1998) or Sydsæter and Hammond (2005). For (2.3)–(2.12), see e.g. Turnbull (1952).

Chapter 3

Limits. Continuity. Differentiation (one variable)

- $f(x)$ tends to A as a *limit* as x approaches a ,
- 3.1 $\lim_{x \rightarrow a} f(x) = A$ or $f(x) \rightarrow A$ as $x \rightarrow a$
if for every number $\varepsilon > 0$ there exists a number $\delta > 0$ such that
 $|f(x) - A| < \varepsilon$ if $x \in D_f$ and $0 < |x - a| < \delta$
- The definition of a limit of a function of one variable. D_f is the domain of f .
- If $\lim_{x \rightarrow a} f(x) = A$ and $\lim_{x \rightarrow a} g(x) = B$, then
- 3.2 $\lim_{x \rightarrow a} (f(x) \pm g(x)) = A \pm B$
 $\lim_{x \rightarrow a} (f(x) \cdot g(x)) = A \cdot B$
 $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{A}{B}$ (if $B \neq 0$)
- Rules for limits.
- f is *continuous* at $x = a$ if $\lim_{x \rightarrow a} f(x) = f(a)$, i.e. if $a \in D_f$ and for each number $\varepsilon > 0$ there is a number $\delta > 0$ such that
- 3.3 $|f(x) - A| < \varepsilon$ if $x \in D_f$ and $|x - a| < \delta$
 f is *continuous on a set* $S \subset D_f$ if f is continuous at each point of S .
- Definition of continuity.
- If f and g are continuous at a , then:
- 3.4 $f \pm g$ and $f \cdot g$ are continuous at a .
 f/g is continuous at a if $g(a) \neq 0$.
- Properties of continuous functions.
- If g is continuous at a , and f is continuous at $g(a)$, then $f(g(x))$ is continuous at a .
- 3.5 Continuity of *composite* functions.
- Any function built from continuous functions by additions, subtractions, multiplications, divisions, and compositions, is continuous where defined.
- 3.6 A useful result.

3.7 f is *uniformly continuous* on a set S if for each $\varepsilon > 0$ there exists a $\delta > 0$ (depending on ε but NOT on x and y) such that

$$|f(x) - f(y)| < \varepsilon \text{ if } x, y \in S \text{ and } |x - y| < \delta$$

Definition of uniform continuity.

3.8 If f is continuous on a closed bounded interval I , then f is uniformly continuous on I .

Continuous functions on closed bounded intervals are uniformly continuous.

3.9 If f is continuous on an interval I containing a and b , and A lies between $f(a)$ and $f(b)$, then there is at least one ξ between a and b such that $A = f(\xi)$.

The *intermediate value theorem*.

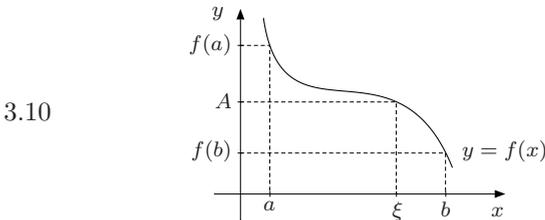

Illustration of the intermediate value theorem.

3.11
$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

The definition of the *derivative*. If the limit exists, f is called *differentiable* at x .

3.12 Other notations for the derivative of $y = f(x)$ include

$$f'(x) = y' = \frac{dy}{dx} = \frac{df(x)}{dx} = Df(x)$$

Other notations for the derivative.

3.13 $y = f(x) \pm g(x) \Rightarrow y' = f'(x) \pm g'(x)$

General rules.

3.14 $y = f(x)g(x) \Rightarrow y' = f'(x)g(x) + f(x)g'(x)$

3.15 $y = \frac{f(x)}{g(x)} \Rightarrow y' = \frac{f'(x)g(x) - f(x)g'(x)}{(g(x))^2}$

3.16 $y = f(g(x)) \Rightarrow y' = f'(g(x)) \cdot g'(x)$

The *chain rule*.

3.17 $y = f(x)^{g(x)} \Rightarrow$

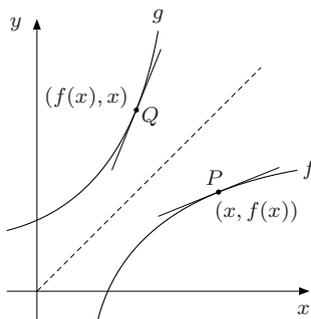

$$y' = f(x)^{g(x)} \left(g'(x) \ln f(x) + g(x) \frac{f'(x)}{f(x)} \right)$$

A useful formula.

- If $g = f^{-1}$ is the inverse of a one-to-one function f , and f is differentiable at x with $f'(x) \neq 0$,
 3.18 then g is differentiable at $f(x)$, and

$$g'(f(x)) = \frac{1}{f'(x)}$$

3.19

f^{-1} denotes the inverse function of f .

The graphs of f and $g = f^{-1}$ are symmetric with respect to the line $y = x$. If the slope of the tangent at P is $k = f'(x)$, then the slope $g'(f(x))$ of the tangent at Q equals $1/k$.

- 3.20 $y = c \Rightarrow y' = 0$ (c constant)
- 3.21 $y = x^a \Rightarrow y' = ax^{a-1}$ (a constant)
- 3.22 $y = \frac{1}{x} \Rightarrow y' = -\frac{1}{x^2}$
- 3.23 $y = \sqrt{x} \Rightarrow y' = \frac{1}{2\sqrt{x}}$
- 3.24 $y = e^x \Rightarrow y' = e^x$
- 3.25 $y = a^x \Rightarrow y' = a^x \ln a$ ($a > 0$)
- 3.26 $y = \ln x \Rightarrow y' = \frac{1}{x}$
- 3.27 $y = \log_a x \Rightarrow y' = \frac{1}{x} \log_a e$ ($a > 0, a \neq 1$)
- 3.28 $y = \sin x \Rightarrow y' = \cos x$
- 3.29 $y = \cos x \Rightarrow y' = -\sin x$
- 3.30 $y = \tan x \Rightarrow y' = \frac{1}{\cos^2 x} = 1 + \tan^2 x$
- 3.31 $y = \cot x \Rightarrow y' = -\frac{1}{\sin^2 x} = -(1 + \cot^2 x)$

Special rules.

$$3.32 \quad y = \sin^{-1} x = \arcsin x \Rightarrow y' = \frac{1}{\sqrt{1-x^2}}$$

Special rules.

$$3.33 \quad y = \cos^{-1} x = \arccos x \Rightarrow y' = -\frac{1}{\sqrt{1-x^2}}$$

$$3.34 \quad y = \tan^{-1} x = \arctan x \Rightarrow y' = \frac{1}{1+x^2}$$

$$3.35 \quad y = \cot^{-1} x = \operatorname{arccot} x \Rightarrow y' = -\frac{1}{1+x^2}$$

$$3.36 \quad y = \sinh x \Rightarrow y' = \cosh x$$

$$3.37 \quad y = \cosh x \Rightarrow y' = \sinh x$$

If f is continuous on $[a, b]$ and differentiable on (a, b) , then there exists at least one point ξ in (a, b) such that

3.38

$$f'(\xi) = \frac{f(b) - f(a)}{b - a}$$

The *mean value theorem*.

3.39

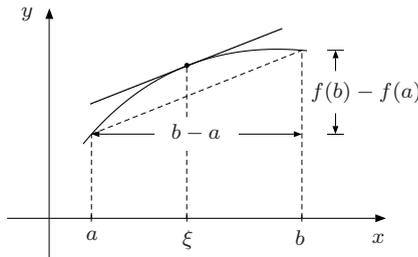

Illustration of the mean value theorem.

If f and g are continuous on $[a, b]$ and differentiable on (a, b) , then there exists at least one point ξ in (a, b) such that

3.40

$$[f(b) - f(a)]g'(\xi) = [g(b) - g(a)]f'(\xi)$$

Cauchy's generalized mean value theorem.

Suppose f and g are differentiable on an interval (α, β) around a , except possibly at a , and suppose that $f(x)$ and $g(x)$ both tend to 0 as x tends to a . If $g'(x) \neq 0$ for all $x \neq a$ in (α, β) and $\lim_{x \rightarrow a} f'(x)/g'(x) = L$ (L finite, $L = \infty$ or $L = -\infty$), then

3.41

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)} = L$$

L'Hôpital's rule. The same rule applies for $x \rightarrow a^+$, $x \rightarrow a^-$, $x \rightarrow \infty$, or $x \rightarrow -\infty$, and also if $f(x) \rightarrow \pm\infty$ and $g(x) \rightarrow \pm\infty$.

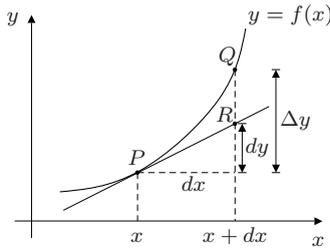

If $y = f(x)$ and dx is any number,

$$3.42 \quad dy = f'(x) dx$$

is the *differential* of y .

Definition of the differential.

3.43

Geometric illustration of the differential.

$$3.44 \quad \Delta y = f(x + dx) - f(x) \approx f'(x) dx$$

when $|dx|$ is small.

A useful approximation, made more precise in (3.45).

$$3.45 \quad f(x + dx) - f(x) = f'(x) dx + \varepsilon dx$$

where $\varepsilon \rightarrow 0$ as $dx \rightarrow 0$

Property of a differentiable function. (If dx is very small, then ε is very small, and εdx is “very, very small”.)

$$3.46 \quad \begin{aligned} d(af + bg) &= a df + b dg \quad (a \text{ and } b \text{ are constants}) \\ d(fg) &= g df + f dg \\ d(f/g) &= (g df - f dg)/g^2 \\ df(u) &= f'(u) du \end{aligned}$$

Rules for differentials. f and g are differentiable, and u is any differentiable function.

References

All formulas are standard and are found in almost any calculus text, e.g. Edwards and Penney (1998), or Sydsæter and Hammond (2005). For uniform continuity, see Rudin (1982).

Chapter 4

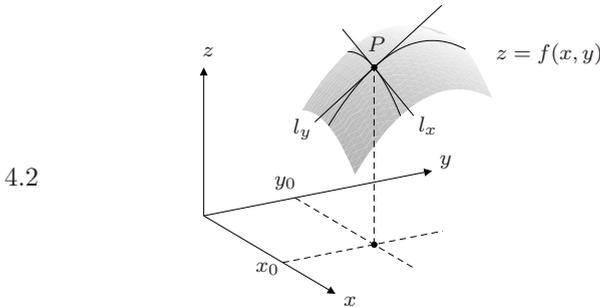

Partial derivatives

If $z = f(x_1, \dots, x_n) = f(\mathbf{x})$, then

$$4.1 \quad \frac{\partial z}{\partial x_i} = \frac{\partial f}{\partial x_i} = f'_i(\mathbf{x}) = D_{x_i} f = D_i f$$

all denote the derivative of $f(x_1, \dots, x_n)$ with respect to x_i when all the other variables are held constant.

Definition of the *partial derivative*. (Other notations are also used.)

4.2

Geometric interpretation of the partial derivatives of a function of two variables, $z = f(x, y)$: $f'_1(x_0, y_0)$ is the slope of the tangent line l_x and $f'_2(x_0, y_0)$ is the slope of the tangent line l_y .

$$4.3 \quad \frac{\partial^2 z}{\partial x_j \partial x_i} = f''_{ij}(x_1, \dots, x_n) = \frac{\partial}{\partial x_j} f'_i(x_1, \dots, x_n)$$

Second-order partial derivatives of $z = f(x_1, \dots, x_n)$.

$$4.4 \quad \frac{\partial^2 f}{\partial x_j \partial x_i} = \frac{\partial^2 f}{\partial x_i \partial x_j}, \quad i, j = 1, 2, \dots, n$$

Young's theorem, valid if the two partials are continuous.

4.5 $f(x_1, \dots, x_n)$ is said to be of class C^k , or simply C^k , in the set $S \subset \mathbb{R}^n$ if all partial derivatives of f of order $\leq k$ are continuous in S .

Definition of a C^k function. (For the definition of continuity, see (12.14).)

$$4.6 \quad z = F(x, y), \quad x = f(t), \quad y = g(t) \Rightarrow \frac{dz}{dt} = F'_1(x, y) \frac{dx}{dt} + F'_2(x, y) \frac{dy}{dt}$$

A *chain rule*.

4.7 If $z = F(x_1, \dots, x_n)$ and $x_i = f_i(t_1, \dots, t_m)$, $i = 1, \dots, n$, then for all $j = 1, \dots, m$

$$\frac{\partial z}{\partial t_j} = \sum_{i=1}^n \frac{\partial F(x_1, \dots, x_n)}{\partial x_i} \frac{\partial x_i}{\partial t_j}$$

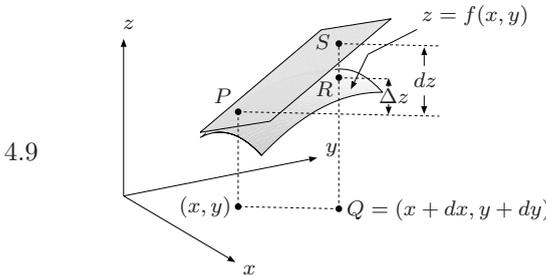

The chain rule. (General case.)

4.8 If $z = f(x_1, \dots, x_n)$ and dx_1, \dots, dx_n are arbitrary numbers,

$$dz = \sum_{i=1}^n f'_i(x_1, \dots, x_n) dx_i$$

Definition of the differential.

is the differential of z .

Geometric illustration of the definition of the differential for functions of two variables. It also illustrates the approximation $\Delta z \approx dz$ in (4.10).

4.10 $\Delta z \approx dz$ when $|dx_1|, \dots, |dx_n|$ are all small, where

$$\Delta z = f(x_1 + dx_1, \dots, x_n + dx_n) - f(x_1, \dots, x_n)$$

A useful approximation, made more precise for differentiable functions in (4.11).

4.11 f is differentiable at \mathbf{x} if $f'_i(\mathbf{x})$ all exist and there exist functions $\varepsilon_i = \varepsilon_i(dx_1, \dots, dx_n)$, $i = 1, \dots, n$, that all approach zero as dx_i all approach zero, and such that

$$\Delta z - dz = \varepsilon_1 dx_1 + \dots + \varepsilon_n dx_n$$

Definition of differentiability.

4.12 If f is a C^1 function, i.e. it has continuous first order partials, then f is differentiable.

An important fact.

4.13

$$d(af + bg) = a df + b dg \quad (a \text{ and } b \text{ constants})$$

$$d(fg) = g df + f dg$$

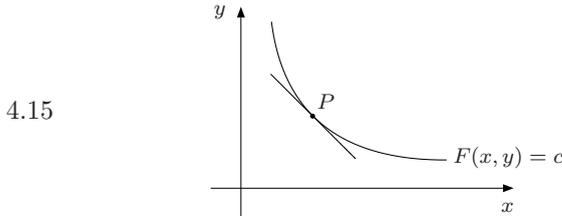

$$d(f/g) = (g df - f dg)/g^2$$

$$dF(u) = F'(u) du$$

Rules for differentials. f and g are differentiable functions of x_1, \dots, x_n , F is a differentiable function of one variable, and u is any differentiable function of x_1, \dots, x_n .

$$4.14 \quad F(x, y) = c \Rightarrow \frac{dy}{dx} = -\frac{F'_1(x, y)}{F'_2(x, y)}$$

Formula for the slope of a level curve for $z = F(x, y)$. For precise assumptions, see (4.17).

The slope of the tangent at P is

$$\frac{dy}{dx} = -\frac{F'_1(x, y)}{F'_2(x, y)}.$$

If $y = f(x)$ is a C^2 function satisfying $F(x, y) = c$, then

$$4.16 \quad f''(x) = -\frac{F''_{11}(F'_2)^2 - 2F''_{12}F'_1F'_2 + F''_{22}(F'_1)^2}{(F'_2)^3}$$

$$= \frac{1}{(F'_2)^3} \begin{vmatrix} 0 & F'_1 & F'_2 \\ F'_1 & F''_{11} & F''_{12} \\ F'_2 & F''_{12} & F''_{22} \end{vmatrix}$$

A useful result. All partials are evaluated at (x, y) .

4.17 If $F(x, y)$ is C^k in a set A , (x_0, y_0) is an interior point of A , $F(x_0, y_0) = c$, and $F'_2(x_0, y_0) \neq 0$, then the equation $F(x, y) = c$ defines y as a C^k function of x , $y = \varphi(x)$, in some neighborhood of (x_0, y_0) , and the derivative of y is

$$\frac{dy}{dx} = -\frac{F'_1(x, y)}{F'_2(x, y)}$$

The *implicit function theorem*. (For a more general result, see (6.3).)

4.18 If $F(x_1, x_2, \dots, x_n, z) = c$ (c constant), then

$$\frac{\partial z}{\partial x_i} = -\frac{\partial F / \partial x_i}{\partial F / \partial z}, \quad i = 1, 2, \dots, n \quad \left(\frac{\partial F}{\partial z} \neq 0 \right)$$

A generalization of (4.14).

Homogeneous and homothetic functions

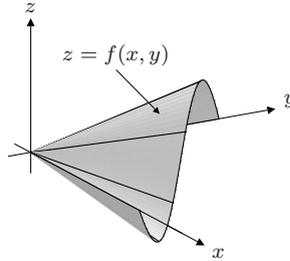

4.19 $f(\mathbf{x}) = f(x_1, x_2, \dots, x_n)$ is *homogeneous of degree k* in $D \subset \mathbb{R}^n$ if

$$f(tx_1, tx_2, \dots, tx_n) = t^k f(x_1, x_2, \dots, x_n)$$

for all $t > 0$ and all $\mathbf{x} = (x_1, x_2, \dots, x_n)$ in D .

The definition of a homogeneous function. D is a *cone* in the sense that $t\mathbf{x} \in D$ whenever $\mathbf{x} \in D$ and $t > 0$.

4.20

Geometric illustration of a function homogeneous of degree 1. (Only a portion of the graph is shown.)

4.21

$f(\mathbf{x}) = f(x_1, \dots, x_n)$ is homogeneous of degree k in the open cone D if and only if

$$\sum_{i=1}^n x_i f'_i(\mathbf{x}) = k f(\mathbf{x}) \text{ for all } \mathbf{x} \text{ in } D$$

Euler's theorem, valid for C^1 functions.

If $f(\mathbf{x}) = f(x_1, \dots, x_n)$ is homogeneous of degree k in the open cone D , then

- 4.22
- $\partial f / \partial x_i$ is homogeneous of degree $k - 1$ in D
 - $\sum_{i=1}^n \sum_{j=1}^n x_i x_j f''_{ij}(\mathbf{x}) = k(k - 1) f(\mathbf{x})$

Properties of homogeneous functions.

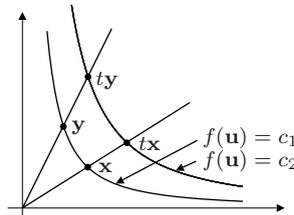

4.23

$f(\mathbf{x}) = f(x_1, \dots, x_n)$ is *homothetic* in the cone D if for all $\mathbf{x}, \mathbf{y} \in D$ and all $t > 0$,

$$f(\mathbf{x}) = f(\mathbf{y}) \Rightarrow f(t\mathbf{x}) = f(t\mathbf{y})$$

Definition of homothetic function.

4.24

Geometric illustration of a homothetic function. With $f(\mathbf{u})$ homothetic, if \mathbf{x} and \mathbf{y} are on the same level curve, then so are $t\mathbf{x}$ and $t\mathbf{y}$ (when $t > 0$).

4.25

Let $f(\mathbf{x})$ be a continuous, homothetic function defined in a connected cone D . Assume that f is strictly increasing along each ray in D , i.e. for each $\mathbf{x}_0 \neq \mathbf{0}$ in D , $f(t\mathbf{x}_0)$ is a strictly increasing function of t . Then there exist a homogeneous function g and a strictly increasing function F such that

$$f(\mathbf{x}) = F(g(\mathbf{x})) \text{ for all } \mathbf{x} \text{ in } D$$

A property of continuous, homothetic functions (which is sometimes taken as the definition of homotheticity). One can assume that g is homogeneous of degree 1.

Gradients, directional derivatives, and tangent planes

$$4.26 \quad \nabla f(\mathbf{x}) = \left(\frac{\partial f(\mathbf{x})}{\partial x_1}, \dots, \frac{\partial f(\mathbf{x})}{\partial x_n} \right)$$

The *gradient* of f at $\mathbf{x} = (x_1, \dots, x_n)$.

$$4.27 \quad f'_{\mathbf{a}}(\mathbf{x}) = \lim_{h \rightarrow 0} \frac{f(\mathbf{x} + h\mathbf{a}) - f(\mathbf{x})}{h}, \quad \|\mathbf{a}\| = 1$$

The *directional derivative* of f at \mathbf{x} in the direction \mathbf{a} .

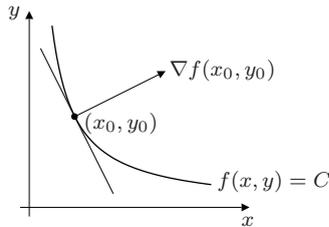

$$4.28 \quad f'_{\mathbf{a}}(\mathbf{x}) = \sum_{i=1}^n f'_i(\mathbf{x})a_i = \nabla f(\mathbf{x}) \cdot \mathbf{a}$$

The relationship between the directional derivative and the gradient.

- 4.29
- $\nabla f(\mathbf{x})$ is orthogonal to the level surface $f(\mathbf{x}) = C$.
 - $\nabla f(\mathbf{x})$ points in the direction of maximal increase of f .
 - $\|\nabla f(\mathbf{x})\|$ measures the rate of change of f in the direction of $\nabla f(\mathbf{x})$.

Properties of the gradient.

4.30

The gradient $\nabla f(x_0, y_0)$ of $f(x, y)$ at (x_0, y_0) .

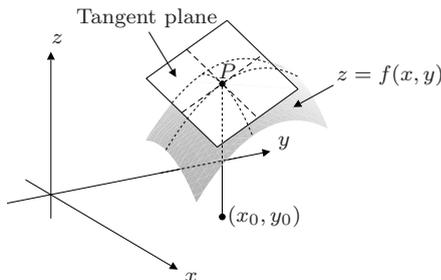

4.31

The *tangent plane* to the graph of $z = f(x, y)$ at the point $P = (x_0, y_0, z_0)$, with $z_0 = f(x_0, y_0)$, has the equation

$$z - z_0 = f'_1(x_0, y_0)(x - x_0) + f'_2(x_0, y_0)(y - y_0)$$

Definition of the tangent plane.

4.32

The graph of a function and its tangent plane.

The *tangent hyperplane* to the level surface

$$4.33 \quad \begin{aligned} F(\mathbf{x}) &= F(x_1, \dots, x_n) = C \\ \text{at the point } \mathbf{x}^0 &= (x_1^0, \dots, x_n^0) \text{ has the equation} \\ \nabla F(\mathbf{x}^0) \cdot (\mathbf{x} - \mathbf{x}^0) &= 0 \end{aligned}$$

Definition of the tangent hyperplane. The vector $\nabla F(\mathbf{x}^0)$ is a *normal* to the hyperplane.

Let f be defined on a convex set $S \subset \mathbb{R}^n$, and let \mathbf{x}^0 be an interior point in S .

$$4.34 \quad \begin{aligned} \bullet \text{ If } f \text{ is concave, there is at least one vector } \mathbf{p} &\text{ in } \mathbb{R}^n \text{ such that} \\ f(\mathbf{x}) - f(\mathbf{x}^0) &\leq \mathbf{p} \cdot (\mathbf{x} - \mathbf{x}^0) \quad \text{for all } \mathbf{x} \text{ in } S \\ \bullet \text{ If } f \text{ is convex, there is at least one vector } \mathbf{p} &\text{ in } \mathbb{R}^n \text{ such that} \\ f(\mathbf{x}) - f(\mathbf{x}^0) &\geq \mathbf{p} \cdot (\mathbf{x} - \mathbf{x}^0) \quad \text{for all } \mathbf{x} \text{ in } S \end{aligned}$$

A vector \mathbf{p} that satisfies the first inequality is called a *supergradient* for f at \mathbf{x}^0 . A vector satisfying the second inequality is called a *subgradient* for f at \mathbf{x}^0 .

$$4.35 \quad \begin{aligned} \text{If } f \text{ is defined on a set } S \subset \mathbb{R}^n \text{ and } \mathbf{x}^0 \text{ is an} &\text{ interior point in } S \text{ at which } f \text{ is differentiable} \\ \text{and } \mathbf{p} \text{ is a vector that satisfies either inequality} &\text{ in (4.34), then } \mathbf{p} = \nabla f(\mathbf{x}^0). \end{aligned}$$

A useful result.

Differentiability for mappings from \mathbb{R}^n to \mathbb{R}^m

A transformation $\mathbf{f} = (f_1, \dots, f_m)$ from a subset A of \mathbb{R}^n into \mathbb{R}^m is *differentiable* at an interior point \mathbf{x} of A if (and only if) each component function $f_i : A \rightarrow \mathbb{R}$, $i = 1, \dots, m$, is differentiable at \mathbf{x} . Moreover, we define the derivative of \mathbf{f} at \mathbf{x} by

$$4.36 \quad \mathbf{f}'(\mathbf{x}) = \begin{pmatrix} \frac{\partial f_1}{\partial x_1}(\mathbf{x}) & \frac{\partial f_1}{\partial x_2}(\mathbf{x}) & \cdots & \frac{\partial f_1}{\partial x_n}(\mathbf{x}) \\ \vdots & \vdots & & \vdots \\ \frac{\partial f_m}{\partial x_1}(\mathbf{x}) & \frac{\partial f_m}{\partial x_2}(\mathbf{x}) & \cdots & \frac{\partial f_m}{\partial x_n}(\mathbf{x}) \end{pmatrix}$$

Generalizes (4.11).

the $m \times n$ matrix whose i th row is $f'_i(\mathbf{x}) = \nabla f_i(\mathbf{x})$.

$$4.37 \quad \begin{aligned} \text{If a transformation } \mathbf{f} \text{ from } A \subset \mathbb{R}^n \text{ into } \mathbb{R}^m &\text{ is differentiable at an interior point } \mathbf{a} \text{ of } A, \text{ then} \\ \mathbf{f} \text{ is continuous at } \mathbf{a}. & \end{aligned}$$

Differentiability implies continuity.

- | | | |
|------|--|---|
| 4.38 | A transformation $\mathbf{f} = (f_1, \dots, f_m)$ from (a subset of) \mathbb{R}^n into \mathbb{R}^m is said to be of <i>class</i> C^k if each of its component functions f_1, \dots, f_m is C^k . | An important definition. (See (4.5).) |
| 4.39 | If \mathbf{f} is a C^1 transformation from an open set $A \subset \mathbb{R}^n$ into \mathbb{R}^m , then \mathbf{f} is differentiable at every point \mathbf{x} in A . | C^1 transformations are differentiable. |
| 4.40 | Suppose $\mathbf{f} : A \rightarrow \mathbb{R}^m$ and $\mathbf{g} : B \rightarrow \mathbb{R}^p$ are defined on $A \subset \mathbb{R}^n$ and $B \subset \mathbb{R}^m$, with $\mathbf{f}(A) \subset B$, and suppose that \mathbf{f} and \mathbf{g} are differentiable at \mathbf{x} and $\mathbf{f}(\mathbf{x})$, respectively. Then the composite transformation $\mathbf{g} \circ \mathbf{f} : A \rightarrow \mathbb{R}^p$ defined by $(\mathbf{g} \circ \mathbf{f})(\mathbf{x}) = \mathbf{g}(\mathbf{f}(\mathbf{x}))$ is differentiable at \mathbf{x} , and $(\mathbf{g} \circ \mathbf{f})'(\mathbf{x}) = \mathbf{g}'(\mathbf{f}(\mathbf{x})) \mathbf{f}'(\mathbf{x})$ | The chain rule. |

References

Most of the formulas are standard and can be found in almost any calculus text, e.g. Edwards and Penney (1998), or Sydsæter and Hammond (2005). For supergradients and differentiability, see e.g. Sydsæter et al. (2005). For properties of homothetic functions, see Simon and Blume (1994), Shephard (1970), and Førsund (1975).

Chapter 5

Elasticities. Elasticities of substitution

5.1
$$\text{El}_x f(x) = \frac{x}{f(x)} f'(x) = \frac{x}{y} \frac{dy}{dx} = \frac{d(\ln y)}{d(\ln x)}$$

$\text{El}_x f(x)$, the *elasticity* of $y = f(x)$ w.r.t. x , is approximately the percentage change in $f(x)$ corresponding to a one per cent increase in x .

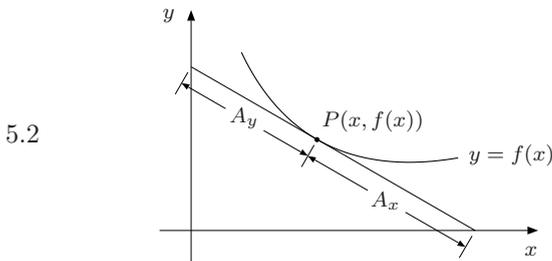

Illustration of Marshall's rule.

5.3 *Marshall's rule:* To find the elasticity of $y = f(x)$ w.r.t. x at the point P in the figure, first draw the tangent to the curve at P . Measure the distance A_y from P to the point where the tangent intersects the y -axis, and the distance A_x from P to where the tangent intersects the x -axis. Then $\text{El}_x f(x) = \pm A_y/A_x$.

Marshall's rule. The distances are measured positive. Choose the plus sign if the curve is increasing at P , the minus sign in the opposite case.

- 5.4
- If $|\text{El}_x f(x)| > 1$, then f is elastic at x .
 - If $|\text{El}_x f(x)| = 1$, then f is unitary elastic at x .
 - If $|\text{El}_x f(x)| < 1$, then f is inelastic at x .
 - If $|\text{El}_x f(x)| = 0$, then f is completely inelastic at x .

Terminology used by many economists.

5.5
$$\text{El}_x(f(x)g(x)) = \text{El}_x f(x) + \text{El}_x g(x)$$

General rules for calculating elasticities.

5.6
$$\text{El}_x \left(\frac{f(x)}{g(x)} \right) = \text{El}_x f(x) - \text{El}_x g(x)$$

5.7	$\text{El}_x(f(x) \pm g(x)) = \frac{f(x) \text{El}_x f(x) \pm g(x) \text{El}_x g(x)}{f(x) \pm g(x)}$	General rules for calculating elasticities.
5.8	$\text{El}_x f(g(x)) = \text{El}_u f(u) \text{El}_x u, \quad u = g(x)$	
5.9	<p>If $y = f(x)$ has an inverse function $x = g(y) = f^{-1}(y)$, then, with $y_0 = f(x_0)$,</p> $\text{El}_y x = \frac{y}{x} \frac{dx}{dy}, \quad \text{i.e.} \quad \text{El}_y(g(y_0)) = \frac{1}{\text{El}_x f(x_0)}$	The elasticity of the inverse function.
5.10	$\text{El}_x A = 0, \quad \text{El}_x x^a = a, \quad \text{El}_x e^x = x.$ (A and a are constants, $A \neq 0$.)	Special rules for elasticities.

5.12	$\text{El}_x \tan x = \frac{x}{\sin x \cos x}, \quad \text{El}_x \cot x = \frac{-x}{\sin x \cos x}$	
5.13	$\text{El}_x \ln x = \frac{1}{\ln x}, \quad \text{El}_x \log_a x = \frac{1}{\ln x}$	
5.14	$\text{El}_i f(\mathbf{x}) = \text{El}_{x_i} f(\mathbf{x}) = \frac{x_i}{f(\mathbf{x})} \frac{\partial f(\mathbf{x})}{\partial x_i}$	The <i>partial elasticity</i> of $f(\mathbf{x}) = f(x_1, \dots, x_n)$ w.r.t. x_i , $i = 1, \dots, n$.
5.15	<p>If $z = F(x_1, \dots, x_n)$ and $x_i = f_i(t_1, \dots, t_m)$ for $i = 1, \dots, n$, then for all $j = 1, \dots, m$,</p> $\text{El}_{t_j} z = \sum_{i=1}^n \text{El}_i F(x_1, \dots, x_n) \text{El}_{t_j} x_i$	The <i>chain rule for elasticities</i> .
5.16	<p>The <i>directional elasticity</i> of f at \mathbf{x}, in the direction of $\mathbf{x}/\ \mathbf{x}\$, is</p> $\text{El}_{\mathbf{a}} f(\mathbf{x}) = \frac{\ \mathbf{x}\ }{f(\mathbf{x})} f'_{\mathbf{a}}(\mathbf{x}) = \frac{1}{f(\mathbf{x})} \nabla f(\mathbf{x}) \cdot \mathbf{x}$	$\text{El}_{\mathbf{a}} f(\mathbf{x})$ is approximately the percentage change in $f(\mathbf{x})$ corresponding to a one per cent increase in each component of \mathbf{x} . (See (4.27)–(4.28) for $f'_{\mathbf{a}}(\mathbf{x})$.)
5.17	$\text{El}_{\mathbf{a}} f(\mathbf{x}) = \sum_{i=1}^n \text{El}_i f(\mathbf{x}), \quad \mathbf{a} = \frac{\mathbf{x}}{\ \mathbf{x}\ }$	A useful fact (the <i>passus equation</i>).
5.18	<p>The <i>marginal rate of substitution</i> (MRS) of y for x is</p> $R_{yx} = \frac{f'_1(x, y)}{f'_2(x, y)}, \quad f(x, y) = c$	R_{yx} is approximately how much one must add of y per unit of x removed to stay on the same level curve for f .

- When f is a utility function, and x and y are goods, R_{yx} is called the *marginal rate of substitution* (abbreviated MRS).
- When f is a production function and x and y are inputs, R_{yx} is called the *marginal rate of technical substitution* (abbreviated MRTS).
- When $f(x, y) = 0$ is a production function in implicit form (for given factor inputs), and x and y are two products, R_{yx} is called the *marginal rate of product transformation* (abbreviated MRPT).

Different special cases of (5.18). See Chapters 25 and 26.

The *elasticity of substitution* between y and x is

$$5.20 \quad \sigma_{yx} = \text{El}_{R_{yx}} \left(\frac{y}{x} \right) = - \frac{\partial \ln \left(\frac{y}{x} \right)}{\partial \ln \left(\frac{f'_2}{f'_1} \right)}, \quad f(x, y) = c$$

σ_{yx} is, approximately, the percentage change in the factor ratio y/x corresponding to a one percent change in the marginal rate of substitution, assuming that f is constant.

$$5.21 \quad \sigma_{yx} = \frac{\frac{1}{xf'_1} + \frac{1}{yf'_2}}{-\frac{f''_{11}}{(f'_1)^2} + 2\frac{f''_{12}}{f'_1f'_2} - \frac{f''_{22}}{(f'_2)^2}}, \quad f(x, y) = c$$

An alternative formula for the elasticity of substitution. Note that $\sigma_{yx} = \sigma_{xy}$.

If $f(x, y)$ is homogeneous of degree 1, then

$$5.22 \quad \sigma_{yx} = \frac{f'_1f'_2}{ff''_{12}}$$

A special case.

$$5.23 \quad h_{ji}(\mathbf{x}) = \frac{\partial f(\mathbf{x})}{\partial x_i} \bigg/ \frac{\partial f(\mathbf{x})}{\partial x_j}, \quad i, j = 1, 2, \dots, n$$

The *marginal rate of substitution* of factor j for factor i .

If f is a strictly increasing transformation of a homogeneous function, as in (4.25), then the marginal rates of substitution in (5.23) are homogeneous of degree 0.

A useful result.

$$5.25 \quad \sigma_{ij} = - \frac{\partial \ln \left(\frac{x_i}{x_j} \right)}{\partial \ln \left(\frac{f'_i}{f'_j} \right)}, \quad f(x_1, \dots, x_n) = c, \quad i \neq j$$

The *elasticity of substitution* in the n -variable case.

$$5.26 \quad \sigma_{ij} = \frac{\frac{1}{x_i f'_i} + \frac{1}{x_j f'_j}}{-\frac{f''_{ii}}{(f'_i)^2} + \frac{2f''_{ij}}{f'_i f'_j} - \frac{f''_{jj}}{(f'_j)^2}}, \quad i \neq j$$

The *elasticity of substitution*, $f(x_1, \dots, x_n) = c$.

References

These formulas will usually not be found in calculus texts. For (5.5)–(5.24), see e.g. Sydsæter and Hammond (2005). For (5.25)–(5.26), see Blackorby and Russell (1989) and Fuss and McFadden (1978). For elasticities of substitution in production theory, see Chapter 25.

Chapter 6

Systems of equations

$$\begin{aligned}
 & f_1(x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_m) = 0 \\
 6.1 \quad & f_2(x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_m) = 0 \\
 & \dots\dots\dots \\
 & f_m(x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_m) = 0
 \end{aligned}$$

A general system of equations with n *exogenous variables*, x_1, \dots, x_n , and m *endogenous variables*, y_1, \dots, y_m .

$$6.2 \quad \frac{\partial \mathbf{f}(\mathbf{x}, \mathbf{y})}{\partial \mathbf{y}} = \begin{pmatrix} \frac{\partial f_1}{\partial y_1} & \dots & \frac{\partial f_1}{\partial y_m} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_m}{\partial y_1} & \dots & \frac{\partial f_m}{\partial y_m} \end{pmatrix}$$

The *Jacobian matrix* of f_1, \dots, f_m with respect to y_1, \dots, y_m .

Suppose f_1, \dots, f_m are C^k functions in a set A in \mathbb{R}^{n+m} , let $(\mathbf{x}^0, \mathbf{y}^0) = (x_1^0, \dots, x_n^0, y_1^0, \dots, y_m^0)$ be a solution to (6.1) in the interior of A . Suppose also that the determinant of the Jacobian matrix $\partial \mathbf{f}(\mathbf{x}, \mathbf{y}) / \partial \mathbf{y}$ in (6.2) is different from 0 at $(\mathbf{x}^0, \mathbf{y}^0)$. Then (6.1) defines y_1, \dots, y_m as C^k functions of x_1, \dots, x_n in some neighborhood of $(\mathbf{x}^0, \mathbf{y}^0)$, and the Jacobian matrix of these functions with respect to \mathbf{x} is

6.3

$$\frac{\partial \mathbf{y}}{\partial \mathbf{x}} = \left(\frac{\partial \mathbf{f}(\mathbf{x}, \mathbf{y})}{\partial \mathbf{y}} \right)^{-1} \frac{\partial \mathbf{f}(\mathbf{x}, \mathbf{y})}{\partial \mathbf{x}}$$

The *general implicit function theorem*. (It gives sufficient conditions for system (6.1) to define the endogenous variables y_1, \dots, y_m as differentiable functions of the exogenous variables x_1, \dots, x_n . (For the case $n = m = 1$, see (4.17).)

$$\begin{aligned}
 & f_1(x_1, x_2, \dots, x_n) = 0 \\
 6.4 \quad & f_2(x_1, x_2, \dots, x_n) = 0 \\
 & \dots\dots\dots \\
 & f_m(x_1, x_2, \dots, x_n) = 0
 \end{aligned}$$

A general system of m equations and n variables.

- 6.5 System (6.4) has k *degrees of freedom* if there is a set of k of the variables that can be freely chosen such that the remaining $n - k$ variables are uniquely determined when the k variables have been assigned specific values. If the variables are restricted to vary in a set S in \mathbb{R}^n , the system has k *degrees of freedom in S* .
 Definition of degrees of freedom for a system of equations.
- 6.6 To find the number of degrees of freedom for a system of equations, count the number, n , of variables and the number, m , of equations. If $n > m$, there are $n - m$ degrees of freedom in the system. If $n < m$, there is, in general, no solution of the system.
 The “counting rule”. This is a rough rule which is *not* valid in general.
- 6.7 If the conditions in (6.3) are satisfied, then system (6.1) has n degrees of freedom.
 A precise (local) counting rule.
- 6.8
$$\mathbf{f}'(\mathbf{x}) = \begin{pmatrix} \frac{\partial f_1(\mathbf{x})}{\partial x_1} & \cdots & \frac{\partial f_1(\mathbf{x})}{\partial x_n} \\ \vdots & & \vdots \\ \frac{\partial f_m(\mathbf{x})}{\partial x_1} & \cdots & \frac{\partial f_m(\mathbf{x})}{\partial x_n} \end{pmatrix}$$

 The *Jacobian matrix* of f_1, \dots, f_m with respect to x_1, \dots, x_n , also denoted by $\partial \mathbf{f}(\mathbf{x})/\partial \mathbf{x}$.
- 6.9 If $\mathbf{x}^0 = (x_1^0, \dots, x_n^0)$ is a solution of (6.4), $m \leq n$, and the rank of the Jacobian matrix $\mathbf{f}'(\mathbf{x})$ is equal to m , then system (6.4) has $n - m$ degrees of freedom in some neighborhood of \mathbf{x}^0 .
 A precise (local) counting rule. (Valid if the functions f_1, \dots, f_m are C^1 .)
- 6.10 The functions $f_1(\mathbf{x}), \dots, f_m(\mathbf{x})$ are *functionally dependent* in an open set A in \mathbb{R}^n if there exists a real-valued C^1 function F defined on an open set containing

$$S = \{(f_1(\mathbf{x}), \dots, f_m(\mathbf{x})) : \mathbf{x} \in A\}$$

 such that

$$F(f_1(\mathbf{x}), \dots, f_m(\mathbf{x})) = 0 \quad \text{for all } \mathbf{x} \text{ in } A$$

 and $\nabla F \neq \mathbf{0}$ in S .
 Definition of functional dependence.
- 6.11 If $f_1(\mathbf{x}), \dots, f_m(\mathbf{x})$ are functionally dependent in an open set $A \subset \mathbb{R}^n$, then the rank of the Jacobian matrix $\mathbf{f}'(\mathbf{x})$ is less than m for all \mathbf{x} in A .
 A necessary condition for functional dependence.
- 6.12 If the equation system (6.4) has solutions, and if $f_1(\mathbf{x}), \dots, f_m(\mathbf{x})$ are functionally dependent, then (6.4) has at least one redundant equation.
 A sufficient condition for the counting rule to fail.

- 6.13 $\det(\mathbf{f}'(\mathbf{x})) = \begin{vmatrix} \frac{\partial f_1(\mathbf{x})}{\partial x_1} & \cdots & \frac{\partial f_1(\mathbf{x})}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_n(\mathbf{x})}{\partial x_1} & \cdots & \frac{\partial f_n(\mathbf{x})}{\partial x_n} \end{vmatrix}$
- The *Jacobian determinant* of f_1, \dots, f_n with respect to x_1, \dots, x_n . (See Chapter 20 for determinants.)
- 6.14 If $f_1(\mathbf{x}), \dots, f_n(\mathbf{x})$ are functionally dependent, then the determinant $\det(\mathbf{f}'(\mathbf{x})) \equiv 0$.
- A special case of (6.11). The converse is not generally true.
- 6.15
$$\begin{aligned} y_1 &= f_1(x_1, \dots, x_n) \\ \dots & \iff \mathbf{y} = \mathbf{f}(\mathbf{x}) \\ y_n &= f_n(x_1, \dots, x_n) \end{aligned}$$
- A *transformation* \mathbf{f} from \mathbb{R}^n to \mathbb{R}^n .
- 6.16 Suppose the transformation \mathbf{f} in (6.15) is C^1 in a neighborhood of \mathbf{x}^0 and that the Jacobian determinant in (6.13) is not zero at $\mathbf{x} = \mathbf{x}^0$. Then there exists a C^1 transformation \mathbf{g} that is locally an inverse of \mathbf{f} , i.e. $\mathbf{g}(\mathbf{f}(\mathbf{x})) = \mathbf{x}$ for all \mathbf{x} in a neighborhood of \mathbf{x}^0 and $\mathbf{f}(\mathbf{g}(\mathbf{y})) = \mathbf{y}$ for all \mathbf{y} in a neighborhood of $\mathbf{y}^0 = \mathbf{f}(\mathbf{x}^0)$.
- The existence of a *local inverse*. (*Inverse function theorem*. Local version.)
- 6.17 Suppose $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is C^1 and that there exist positive numbers h and k such that $|\det(\mathbf{f}'(\mathbf{x}))| \geq h$ and $|\partial f_i(\mathbf{x})/\partial x_j| \leq k$ for all \mathbf{x} and all $i, j = 1, \dots, n$. Then \mathbf{f} has an inverse defined and C^1 on all of \mathbb{R}^n .
- Existence of a *global inverse*. (Hadamard's theorem.)
- 6.18 Suppose $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is C^1 and that the determinant in (6.13) is $\neq 0$ for all \mathbf{x} . Then $\mathbf{f}(\mathbf{x})$ has an inverse that is C^1 and defined over all of \mathbb{R}^n , if and only if $\inf\{\|\mathbf{f}(\mathbf{x})\| : \|\mathbf{x}\| \geq n\} \rightarrow \infty$ as $n \rightarrow \infty$.
- A *global inverse function theorem*.
- 6.19 Suppose $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is C^1 and let Ω be the rectangle $\Omega = \{\mathbf{x} \in \mathbb{R}^n : \mathbf{a} \leq \mathbf{x} \leq \mathbf{b}\}$, where \mathbf{a} and \mathbf{b} are given vectors in \mathbb{R}^n . Then \mathbf{f} is one-to-one in Ω if *one* of the following conditions is satisfied for all \mathbf{x} :
- The Jacobian matrix $\mathbf{f}'(\mathbf{x})$ has only strictly positive principal minors.
 - The Jacobian matrix $\mathbf{f}'(\mathbf{x})$ has only strictly negative principal minors.
- A *Gale–Nikaido theorem*. (For principal minors, see (20.15).)

- 6.20 An $n \times n$ matrix \mathbf{A} (not necessarily symmetric) is called *positive quasidefinite* if $\mathbf{x}'\mathbf{A}\mathbf{x} > 0$ for every n -vector $\mathbf{x} \neq \mathbf{0}$. | Definition of a positive quasidefinite matrix.
- 6.21 Suppose $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is a C^1 function and assume that the Jacobian matrix $\mathbf{f}'(\mathbf{x})$ is positive quasidefinite everywhere in a convex set Ω . Then \mathbf{f} is one-to-one in Ω . | A Gale–Nikaido theorem.
- 6.22 $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is called a *contraction mapping* if there exists a constant k in $[0, 1)$ such that

$$\|\mathbf{f}(\mathbf{x}) - \mathbf{f}(\mathbf{y})\| \leq k\|\mathbf{x} - \mathbf{y}\|$$
for all \mathbf{x} and \mathbf{y} in \mathbb{R}^n . | Definition of a contraction mapping.
- 6.23 If $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is a contraction mapping, then \mathbf{f} has a unique *fixed point*, i.e. a point \mathbf{x}^* in \mathbb{R}^n such that $\mathbf{f}(\mathbf{x}^*) = \mathbf{x}^*$. For any \mathbf{x}_0 in \mathbb{R}^n we have $\mathbf{x}^* = \lim_{n \rightarrow \infty} \mathbf{x}_n$, where $\mathbf{x}_n = \mathbf{f}(\mathbf{x}_{n-1})$ for $n \geq 1$. | The existence of a fixed point for a contraction mapping. (This result can be generalized to complete metric spaces. See (18.26).)
- 6.24 Let S be a nonempty subset of \mathbb{R}^n , and let \mathcal{B} denote the set of all bounded functions from S into \mathbb{R}^m . The *supremum distance* between two functions φ and ψ in \mathcal{B} is defined as

$$d(\varphi, \psi) = \sup_{\mathbf{x} \in S} \|\varphi(\mathbf{x}) - \psi(\mathbf{x})\|$$
 | A definition of distance between functions. ($F : S \rightarrow \mathbb{R}^m$ is called *bounded* on S if there exists a positive number M such that $\|F(\mathbf{x})\| \leq M$ for all \mathbf{x} in S .)
- 6.25 Let S be a nonempty subset of \mathbb{R}^n and let \mathcal{B} be the set of all bounded functions from S into \mathbb{R}^m . Suppose that the function $T : \mathcal{B} \rightarrow \mathcal{B}$ is a contraction mapping in the sense that

$$d(T(\varphi), T(\psi)) \leq \beta d(\varphi, \psi) \quad \text{for all } \varphi, \psi \text{ in } \mathcal{B}$$
Then there exists a unique function φ^* in \mathcal{B} such that $\varphi^* = T(\varphi^*)$. | A contraction mapping theorem for spaces of bounded functions.
- 6.26 Let K be a nonempty, compact and convex set in \mathbb{R}^n and \mathbf{f} a continuous function mapping K into K . Then \mathbf{f} has a fixed point $\mathbf{x}^* \in K$, i.e. a point \mathbf{x}^* such that $\mathbf{f}(\mathbf{x}^*) = \mathbf{x}^*$. | Brouwer's fixed point theorem.

6.27

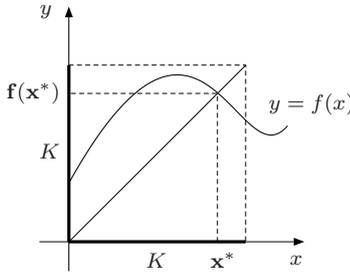

Illustration of Brouwer's fixed point theorem for $n = 1$.

6.28

Let K be a nonempty compact, convex set in \mathbb{R}^n and \mathbf{f} a correspondence that to each point \mathbf{x} in K associates a nonempty, convex subset $\mathbf{f}(\mathbf{x})$ of K . Suppose that \mathbf{f} has a closed graph, i.e. the set

$$\{(\mathbf{x}, \mathbf{y}) \in \mathbb{R}^{2n} : \mathbf{x} \in K \text{ and } \mathbf{y} \in \mathbf{f}(\mathbf{x})\}$$

is closed in \mathbb{R}^{2n} . Then \mathbf{f} has a fixed point, i.e. a point \mathbf{x}^* in K , such that $\mathbf{x}^* \in \mathbf{f}(\mathbf{x}^*)$.

Kakutani's fixed point theorem. (See (12.27) for the definition of correspondences.)

6.29

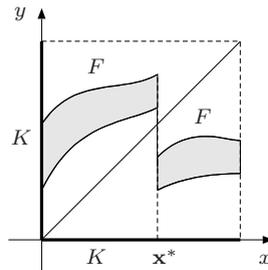

Illustration of Kakutani's fixed point theorem for $n = 1$.

6.30

If $\mathbf{x} = (x_1, \dots, x_n)$ and $\mathbf{y} = (y_1, \dots, y_n)$ are two points in \mathbb{R}^n , then the *meet* $\mathbf{x} \wedge \mathbf{y}$ and *join* $\mathbf{x} \vee \mathbf{y}$ of \mathbf{x} and \mathbf{y} are points in \mathbb{R}^n defined as follows:

$$\mathbf{x} \wedge \mathbf{y} = (\min\{x_1, y_1\}, \dots, \min\{x_n, y_n\})$$

$$\mathbf{x} \vee \mathbf{y} = (\max\{x_1, y_1\}, \dots, \max\{x_n, y_n\})$$

Definition of the meet and the join of two vectors in \mathbb{R}^n .

6.31

A set S in \mathbb{R}^n is called a *sublattice* of \mathbb{R}^n if the meet and the join of any two points in S are also in S . If S is also a compact set, the S is called a *compact sublattice*.

Definition of a (compact) sublattice of \mathbb{R}^n .

6.32

Let S be a nonempty compact sublattice of \mathbb{R}^n . Let $\mathbf{f} : S \rightarrow S$ be an increasing function, i.e. if $\mathbf{x}, \mathbf{y} \in S$ and $\mathbf{x} \leq \mathbf{y}$, then $\mathbf{f}(\mathbf{x}) \leq \mathbf{f}(\mathbf{y})$. Then \mathbf{f} has a fixed point in S , i.e. a point \mathbf{x}^* in S such that $\mathbf{f}(\mathbf{x}^*) = \mathbf{x}^*$.

Tarski's fixed point theorem. (The theorem is not valid for decreasing functions. See (6.33).)

Chapter 7

Inequalities

$$7.1 \quad ||a| - |b|| \leq |a \pm b| \leq |a| + |b|$$

Triangle inequalities.
 $a, b \in \mathbb{R}$ (or \mathbb{C}).

$$7.2 \quad \frac{n}{\sum_{i=1}^n 1/a_i} \leq \left(\prod_{i=1}^n a_i \right)^{1/n} \leq \frac{\sum_{i=1}^n a_i}{n}, \quad a_i > 0$$

Harmonic mean \leq
geometric mean \leq
arithmetic mean.
Equalities if and only if
 $a_1 = \cdots = a_n$.

$$7.3 \quad \frac{2}{1/a_1 + 1/a_2} \leq \sqrt{a_1 a_2} \leq \frac{a_1 + a_2}{2}$$

(7.2) for $n = 2$.

$$7.4 \quad (1 + x)^n \geq 1 + nx \quad (n \in \mathbb{N}, x \geq -1)$$

Bernoulli's inequality.

$$7.5 \quad a_1^{\lambda_1} \cdots a_n^{\lambda_n} \leq \lambda_1 a_1 + \cdots + \lambda_n a_n$$

Inequality for *weighted means*. $a_i \geq 0$,
 $\sum_{i=1}^n \lambda_i = 1$, $\lambda_i \geq 0$.

$$7.6 \quad a_1^\lambda a_2^{1-\lambda} \leq \lambda a_1 + (1 - \lambda) a_2$$

(7.5) for $n = 2$, $a_1 \geq 0$,
 $a_2 \geq 0$, $\lambda \in [0, 1]$.

$$7.7 \quad \sum_{i=1}^n |a_i b_i| \leq \left[\sum_{i=1}^n |a_i|^p \right]^{1/p} \left[\sum_{i=1}^n |b_i|^q \right]^{1/q}$$

Hölder's inequality.
 $p, q > 1$, $1/p + 1/q = 1$.
Equality if $|b_i| = c|a_i|^{p-1}$
for a nonnegative constant c .

$$7.8 \quad \left[\sum_{i=1}^n |a_i b_i| \right]^2 \leq \left[\sum_{i=1}^n a_i^2 \right] \left[\sum_{i=1}^n b_i^2 \right]$$

Cauchy-Schwarz's inequality. (Put $p = q = 2$
in (7.7).)

$$7.9 \quad \left[\sum_{i=1}^n a_i \right] \left[\sum_{i=1}^n b_i \right] \leq n \sum_{i=1}^n a_i b_i$$

Chebyshev's inequality.
 $a_1 \geq \cdots \geq a_n$,
 $b_1 \geq \cdots \geq b_n$.

- 7.10 $\left[\sum_{i=1}^n |a_i + b_i|^p \right]^{1/p} \leq \left[\sum_{i=1}^n |a_i|^p \right]^{1/p} + \left[\sum_{i=1}^n |b_i|^p \right]^{1/p}$ | *Minkowski's inequality.*
 $p \geq 1$. Equality if $b_i = ca_i$ for a nonnegative constant c .
- 7.11 If f is convex, then $f\left[\sum_{i=1}^n a_i x_i\right] \leq \sum_{i=1}^n a_i f(x_i)$ | *Jensen's inequality.*
 $\sum_{i=1}^n a_i = 1$, $a_i \geq 0$,
 $i = 1, \dots, n$.
- 7.12 $\left[\sum_{i=1}^n |a_i|^q \right]^{1/q} \leq \left[\sum_{i=1}^n |a_i|^p \right]^{1/p}$ | *Another Jensen's inequality;* $0 < p < q$.
- 7.13 $\int_a^b |f(x)g(x)| dx \leq \left[\int_a^b |f(x)|^p dx \right]^{1/p} \left[\int_a^b |g(x)|^q dx \right]^{1/q}$ | *Hölder's inequality.* $p > 1$, $q > 1$, $1/p + 1/q = 1$. Equality if $|g(x)| = c|f(x)|^{p-1}$ for a nonnegative constant c .
- 7.14 $\left[\int_a^b f(x)g(x) dx \right]^2 \leq \int_a^b (f(x))^2 dx \int_a^b (g(x))^2 dx$ | *Cauchy-Schwarz's inequality.*
- 7.15 $\left[\int_a^b |f(x) + g(x)|^p dx \right]^{1/p} \leq \left[\int_a^b |f(x)|^p dx \right]^{1/p} + \left[\int_a^b |g(x)|^p dx \right]^{1/p}$ | *Minkowski's inequality.*
 $p \geq 1$. Equality if $g(x) = cf(x)$ for a nonnegative constant c .
- 7.16 If f is convex, then $f\left(\int a(x)g(x) dx\right) \leq \int a(x)f(g(x)) dx$ | *Jensen's inequality.*
 $a(x) \geq 0$, $f(u) \geq 0$,
 $\int a(x) dx = 1$. f is defined on the range of g .
- 7.17 If f is convex on the interval I and X is a random variable with finite expectation, then $f(E[X]) \leq E[f(X)]$ | *Special case of Jensen's inequality.* E is the expectation operator.
If f is strictly convex, the inequality is strict unless X is a constant with probability 1.
- 7.18 If U is concave on the interval I and X is a random variable with finite expectation, then $E[U(X)] \leq U(E[X])$ | *An important fact in utility theory.* (It follows from (7.17) by putting $f = -U$.)

References

Hardy, Littlewood, and Pólya (1952) is still a good reference for inequalities.

Chapter 8

Series. Taylor's formula

8.1 $\sum_{i=0}^{n-1} (a + id) = na + \frac{n(n-1)d}{2}$ | Sum of the first n terms of an *arithmetic series*.

8.2 $a + ak + ak^2 + \dots + ak^{n-1} = a \frac{1 - k^n}{1 - k}, k \neq 1$ | Sum of the first n terms of a *geometric series*.

8.3 $a + ak + \dots + ak^{n-1} + \dots = \frac{a}{1 - k}$ if $|k| < 1$ | Sum of an infinite geometric series.

8.4 $\sum_{n=1}^{\infty} a_n = s$ means that $\lim_{n \rightarrow \infty} \sum_{k=1}^n a_k = s$ | Definition of the *convergence* of an infinite series. If the series does not converge, it *diverges*.

8.5 $\sum_{n=1}^{\infty} a_n$ converges $\Rightarrow \lim_{n \rightarrow \infty} a_n = 0$ | A necessary (but NOT sufficient) condition for the convergence of an infinite series.

8.6 $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < 1 \Rightarrow \sum_{n=1}^{\infty} a_n$ converges | The *ratio test*.

8.7 $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| > 1 \Rightarrow \sum_{n=1}^{\infty} a_n$ diverges | The *ratio test*.

8.8 If $f(x)$ is a positive-valued, decreasing, and continuous function for $x \geq 1$, and if $a_n = f(n)$ for all integers $n \geq 1$, then the infinite series and the improper integral
 $\sum_{n=1}^{\infty} a_n$ and $\int_1^{\infty} f(x) dx$
either both converge or both diverge. | The *integral test*.

- If $0 \leq a_n \leq b_n$ for all n , then
- 8.9
- $\sum a_n$ converges if $\sum b_n$ converges.
 - $\sum b_n$ diverges if $\sum a_n$ diverges.
- | The *comparison test*.
- 8.10 $\sum_{n=1}^{\infty} \frac{1}{n^p}$ is convergent $\iff p > 1$
- | An important result.
- 8.11 A series $\sum_{n=1}^{\infty} a_n$ is said to *converge absolutely* if the series $\sum_{n=1}^{\infty} |a_n|$ converges.
- | Definition of absolute convergence. $|a_n|$ denotes the absolute value of a_n .
- 8.12 Every absolutely convergent series is convergent, but not all convergent series are absolutely convergent.
- | A convergent series that is not absolutely convergent, is called *conditionally convergent*.
- 8.13 If a series is absolutely convergent, then the sum is independent of the order in which terms are summed. A conditionally convergent series can be made to converge to any number (or even diverge) by suitable rearranging the order of the terms.
- | Important results on the convergence of series.
- 8.14 $f(x) \approx f(a) + f'(a)(x - a)$ (x close to a)
- | *First-order (linear) approximation* about $x = a$.
- 8.15 $f(x) \approx f(a) + f'(a)(x - a) + \frac{1}{2}f''(a)(x - a)^2$
(x close to a)
- | *Second-order (quadratic) approximation* about $x = a$.
- 8.16 $f(x) = f(0) + \frac{f'(0)}{1!}x + \cdots + \frac{f^{(n)}(0)}{n!}x^n$
 $+ \frac{f^{(n+1)}(\theta x)}{(n+1)!}x^{n+1}, \quad 0 < \theta < 1$
- | *Maclaurin's formula*. The last term is Lagrange's error term.
- 8.17 $f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \cdots$
- | The *Maclaurin series* for $f(x)$, valid for those x for which the error term in (8.16) tends to 0 as n tends to ∞ .
- 8.18 $f(x) = f(a) + \frac{f'(a)}{1!}(x-a) + \cdots + \frac{f^{(n)}(a)}{n!}(x-a)^n$
 $+ \frac{f^{(n+1)}(a + \theta(x-a))}{(n+1)!}(x-a)^{n+1}, \quad 0 < \theta < 1$
- | *Taylor's formula*. The last term is Lagrange's error term.

$$8.19 \quad f(x) = f(a) + \frac{f'(a)}{1!}(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \dots$$

The *Taylor series* for $f(x)$, valid for those x where the error term in (8.18) tends to 0 as n tends to ∞ .

$$8.20 \quad f(x, y) \approx f(a, b) + f'_1(a, b)(x-a) + f'_2(a, b)(y-b) \\ ((x, y) \text{ close to } (a, b))$$

First-order (linear) approximation to $f(x, y)$ about (a, b) .

$$8.21 \quad f(x, y) \approx f(a, b) + f'_1(a, b)(x-a) + f'_2(a, b)(y-b) \\ + \frac{1}{2}[f''_{11}(a, b)(x-a)^2 + 2f''_{12}(a, b)(x-a)(y-b) + f''_{22}(a, b)(y-b)^2]$$

Second-order (quadratic) approximation to $f(x, y)$ about (a, b) .

$$8.22 \quad f(\mathbf{x}) = f(\mathbf{a}) + \sum_{i=1}^n f'_i(\mathbf{a})(x_i - a_i) \\ + \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n f''_{ij}(\mathbf{a} + \theta(\mathbf{x} - \mathbf{a}))(x_i - a_i)(x_j - a_j)$$

Taylor's formula of order 2 for functions of n variables, $\theta \in (0, 1)$.

$$8.23 \quad e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$$

Valid for all x .

$$8.24 \quad \ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots$$

Valid if $-1 < x \leq 1$.

$$8.25 \quad (1+x)^m = \binom{m}{0} + \binom{m}{1}x + \binom{m}{2}x^2 + \dots$$

Valid if $-1 < x < 1$. For the definition of $\binom{m}{k}$, see (8.30).

$$8.26 \quad \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \frac{x^9}{9!} - \dots$$

Valid for all x .

$$8.27 \quad \cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \dots$$

Valid for all x .

$$8.28 \quad \arcsin x = x + \frac{1}{2} \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} \frac{x^5}{5} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \frac{x^7}{7} + \dots$$

Valid if $|x| \leq 1$.

$$8.29 \quad \arctan x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$$

Valid if $|x| \leq 1$.

$$8.30 \quad \bullet \binom{r}{k} = \frac{r(r-1)\dots(r-k+1)}{k!} \\ \bullet \binom{r}{0} = 1, \quad \binom{r}{-k} = 0$$

Binomial coefficients. (r is an arbitrary real number, k is a natural number.)

8.31	<ul style="list-style-type: none"> • $\binom{n}{k} = \frac{n!}{k!(n-k)!} \quad (0 \leq k \leq n)$ • $\binom{n}{k} = \binom{n}{n-k} \quad (n \geq 0)$ • $\binom{r}{k} = \binom{r-1}{k-1} + \binom{r-1}{k}$ • $\binom{-r}{k} = (-1)^k \binom{r+k-1}{k}$ • $\binom{r}{k} = \frac{r}{k} \binom{r-1}{k-1} \quad (k \neq 0)$ 	<p>Important properties of the binomial coefficients. n and k are integers, and r is a real number.</p>
8.32	$\binom{r}{m} \binom{m}{k} = \binom{r}{k} \binom{r-k}{m-k}$	m and k are integers.
8.33	$\sum_{k=0}^n \binom{r}{k} \binom{s}{n-k} = \binom{r+s}{n}$	n is a nonnegative integer.
8.34	$\sum_{k=0}^n \binom{r+k}{k} = \binom{r+n+1}{n}$	n is a nonnegative integer.
8.35	$\sum_{k=0}^n \binom{k}{m} = \binom{n+1}{m+1}$	m and n are nonnegative integers.
8.36	$\sum_{k=0}^n \binom{n}{k} a^{n-k} b^k = (a+b)^n$	<i>Newton's binomial formula.</i>
8.37	$\sum_{k=0}^n \binom{n}{k} = (1+1)^n = 2^n$	A special case of (8.36).
8.38	$\sum_{k=0}^n \binom{n}{k} k = n2^{n-1} \quad (n \geq 0)$	
8.39	$\sum_{k=0}^n \binom{n}{k} k^2 = (n^2 + n)2^{n-2} \quad (n \geq 0)$	
8.40	$\sum_{k=0}^n \binom{n}{k}^2 = \binom{2n}{n}$	
8.41	$(a_1 + a_2 + \cdots + a_m)^n = \sum_{k_1 + \cdots + k_m = n} \frac{n!}{k_1! \cdots k_m!} a_1^{k_1} \cdots a_m^{k_m}$	The <i>multinomial formula</i> .

-
- 8.42 $1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2}$ | Summation formulas.
- 8.43 $1 + 3 + 5 + \cdots + (2n-1) = n^2$ |
- 8.44 $1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}$ |
- 8.45 $1^3 + 2^3 + 3^3 + \cdots + n^3 = \left(\frac{n(n+1)}{2}\right)^2$ |
- 8.46 $1^4 + 2^4 + 3^4 + \cdots + n^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$ |
- 8.47 $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{n^2} + \cdots = \frac{\pi^2}{6}$ | A famous result.
- 8.48 $\lim_{n \rightarrow \infty} \left[\left(\frac{1}{1} + \frac{1}{2} + \cdots + \frac{1}{n} \right) - \ln n \right] = \gamma \approx 0.5772 \dots$ | The constant γ is called *Euler's constant*.

References

All formulas are standard and are usually found in calculus texts, e.g. Edwards and Penney (1998). For results about binomial coefficients, see a book on probability theory, or e.g. Graham, Knuth, and Patashnik (1989).

Chapter 9

Integration

Indefinite integrals

- | | | |
|------|--|--|
| 9.1 | $\int f(x) dx = F(x) + C \iff F'(x) = f(x)$ | Definition of the <i>indefinite integral</i> . |
| 9.2 | $\int (af(x) + bg(x)) dx = a \int f(x) dx + b \int g(x) dx$ | <i>Linearity</i> of the integral.
a and b are constants. |
| 9.3 | $\int f(x)g'(x) dx = f(x)g(x) - \int f'(x)g(x) dx$ | <i>Integration by parts</i> . |
| 9.4 | $\int f(x) dx = \int f(g(t))g'(t) dt, \quad x = g(t)$ | <i>Change of variable</i> .
(<i>Integration by substitution</i> .) |
| 9.5 | $\int x^n dx = \begin{cases} \frac{x^{n+1}}{n+1} + C, & n \neq -1 \\ \ln x + C, & n = -1 \end{cases}$ | Special integration results. |
| 9.6 | $\int a^x dx = \frac{1}{\ln a} a^x + C, \quad a > 0, a \neq 1$ | |
| 9.7 | $\int e^x dx = e^x + C$ | |
| 9.8 | $\int xe^x dx = xe^x - e^x + C$ | |

| 9.10 | $\int \log_a x dx = x \log_a x - x \log_a e + C, \quad a > 0, a \neq 1$ | |

9.11	$\int \ln x \, dx = x \ln x - x + C$	Special integration results.
9.12	$\int x^n \ln x \, dx = \frac{x^{n+1}((n+1) \ln x - 1)}{(n+1)^2} + C$	$(n \neq -1)$
9.13	$\int \sin x \, dx = -\cos x + C$	
9.14	$\int \cos x \, dx = \sin x + C$	
9.15	$\int \tan x \, dx = -\ln \cos x + C$	
9.16	$\int \cot x \, dx = \ln \sin x + C$	
9.17	$\int \frac{1}{\sin x} \, dx = \ln \left \frac{1 - \cos x}{\sin x} \right + C$	
9.18	$\int \frac{1}{\cos x} \, dx = \ln \left \frac{1 + \sin x}{\cos x} \right + C$	
9.19	$\int \frac{1}{\sin^2 x} \, dx = -\cot x + C$	
9.20	$\int \frac{1}{\cos^2 x} \, dx = \tan x + C$	
9.21	$\int \sin^2 x \, dx = \frac{1}{2}x - \frac{1}{2}\sin x \cos x + C$	
9.22	$\int \cos^2 x \, dx = \frac{1}{2}x + \frac{1}{2}\sin x \cos x + C$	
9.23	$\int \sin^n x \, dx =$ $-\frac{\sin^{n-1} x \cos x}{n} + \frac{n-1}{n} \int \sin^{n-2} x \, dx$	$(n \neq 0)$
9.24	$\int \cos^n x \, dx =$ $\frac{\cos^{n-1} x \sin x}{n} + \frac{n-1}{n} \int \cos^{n-2} x \, dx$	$(n \neq 0)$

- 9.25 $\int e^{\alpha x} \sin \beta x \, dx = \frac{e^{\alpha x}}{\alpha^2 + \beta^2} (\alpha \sin \beta x - \beta \cos \beta x) + C$ $\left| \begin{array}{l} (\alpha^2 + \beta^2 \neq 0) \end{array} \right.$
- 9.26 $\int e^{\alpha x} \cos \beta x \, dx = \frac{e^{\alpha x}}{\alpha^2 + \beta^2} (\beta \sin \beta x + \alpha \cos \beta x) + C$ $\left| \begin{array}{l} (\alpha^2 + \beta^2 \neq 0) \end{array} \right.$
- 9.27 $\int \frac{1}{x^2 - a^2} \, dx = \frac{1}{2a} \ln \left| \frac{x - a}{x + a} \right| + C$ $\left| \begin{array}{l} (a \neq 0) \end{array} \right.$
- 9.28 $\int \frac{1}{x^2 + a^2} \, dx = \frac{1}{a} \arctan \frac{x}{a} + C$ $\left| \begin{array}{l} (a \neq 0) \end{array} \right.$
- 9.29 $\int \frac{1}{\sqrt{a^2 - x^2}} \, dx = \arcsin \frac{x}{a} + C$ $\left| \begin{array}{l} (a > 0) \end{array} \right.$
- 9.30 $\int \frac{1}{\sqrt{x^2 \pm a^2}} \, dx = \ln \left| x + \sqrt{x^2 \pm a^2} \right| + C$ $\left| \begin{array}{l} \end{array} \right.$
- 9.31 $\int \sqrt{a^2 - x^2} \, dx = \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \arcsin \frac{x}{a} + C$ $\left| \begin{array}{l} (a > 0) \end{array} \right.$
- 9.32 $\int \sqrt{x^2 \pm a^2} \, dx = \frac{x}{2} \sqrt{x^2 \pm a^2} \pm \frac{a^2}{2} \ln \left| x + \sqrt{x^2 \pm a^2} \right| + C$ $\left| \begin{array}{l} \end{array} \right.$
- 9.33 $\int \frac{dx}{ax^2 + 2bx + c} = \frac{1}{2\sqrt{b^2 - ac}} \ln \left| \frac{ax + b - \sqrt{b^2 - ac}}{ax + b + \sqrt{b^2 - ac}} \right| + C$ $\left| \begin{array}{l} (b^2 > ac, a \neq 0) \end{array} \right.$
- 9.34 $\int \frac{dx}{ax^2 + 2bx + c} = \frac{1}{\sqrt{ac - b^2}} \arctan \frac{ax + b}{\sqrt{ac - b^2}} + C$ $\left| \begin{array}{l} (b^2 < ac) \end{array} \right.$
- 9.35 $\int \frac{dx}{ax^2 + 2bx + c} = \frac{-1}{ax + b} + C$ $\left| \begin{array}{l} (b^2 = ac, a \neq 0) \end{array} \right.$

Definite integrals

$$9.36 \quad \int_a^b f(x) dx = \left|_a^b F(x) = F(b) - F(a)\right.$$

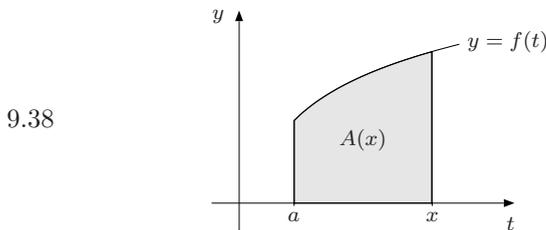

if $F'(x) = f(x)$ for all x in $[a, b]$.

Definition of the *definite integral* of a function f .

$$9.37 \quad \bullet \quad A(x) = \int_a^x f(t) dt \Rightarrow A'(x) = f(x)$$

$$\bullet \quad A(x) = \int_x^b f(t) dt \Rightarrow A'(x) = -f(x)$$

Important facts.

The shaded area is $A(x) = \int_a^x f(t) dt$, and the derivative of the area function $A(x)$ is $A'(x) = f(x)$.

$$9.39 \quad \int_a^b f(x) dx = - \int_b^a f(x) dx$$

$$\int_a^a f(x) dx = 0$$

$$\int_a^b \alpha f(x) dx = \alpha \int_a^b f(x) dx$$

$$\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$$

a, b, c , and α are arbitrary real numbers.

$$9.40 \quad \int_a^b f(g(x))g'(x) dx = \int_{g(a)}^{g(b)} f(u) du, \quad u = g(x)$$

Change of variable. (Integration by substitution.)

$$9.41 \quad \int_a^b f(x)g'(x) dx = \left|_a^b f(x)g(x) - \int_a^b f'(x)g(x) dx\right.$$

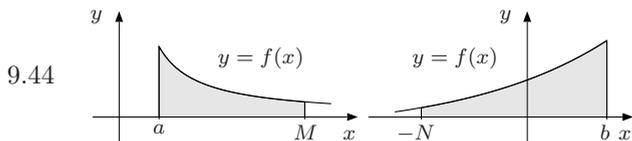

Integration by parts.

$$9.42 \quad \int_a^\infty f(x) dx = \lim_{M \rightarrow \infty} \int_a^M f(x) dx$$

If the limit exists, the integral is *convergent*. (In the opposite case, the integral *diverges*.)

$$9.43 \quad \int_{-\infty}^b f(x) dx = \lim_{N \rightarrow \infty} \int_{-N}^b f(x) dx$$

If the limit exists, the integral is *convergent*. (In the opposite case, the integral *diverges*.)

The figures illustrate (9.42) and (9.43). The shaded areas are $\int_a^M f(x) dx$ in the first figure, and $\int_{-N}^b f(x) dx$ in the second.

9.45

$$\begin{aligned} \int_{-\infty}^{\infty} f(x) dx &= \int_{-\infty}^a f(x) dx + \int_a^{\infty} f(x) dx \\ &= \lim_{N \rightarrow \infty} \int_{-N}^a f(x) dx + \lim_{M \rightarrow \infty} \int_a^M f(x) dx \end{aligned}$$

Both limits on the right-hand side must exist. a is an arbitrary number. The integral is then said to *converge*. (If either of the limits does not exist, the integral *diverges*.)

9.46

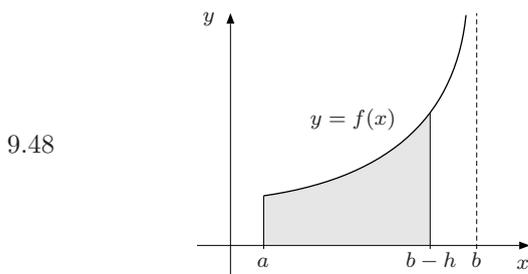

$$\int_a^b f(x) dx = \lim_{h \rightarrow 0^+} \int_{a+h}^b f(x) dx$$

The definition of the integral if f is continuous in $(a, b]$.

9.47

$$\int_a^b f(x) dx = \lim_{h \rightarrow 0^+} \int_a^{b-h} f(x) dx$$

The definition of the integral if f is continuous in $[a, b)$.

Illustrating definition (9.47). The shaded area is $\int_a^{b-h} f(x) dx$.

9.49

$$|f(x)| \leq g(x) \text{ for all } x \geq a \Rightarrow \left| \int_a^{\infty} f(x) dx \right| \leq \int_a^{\infty} g(x) dx$$

Comparison test for integrals. f and g are continuous for $x \geq a$.

9.50

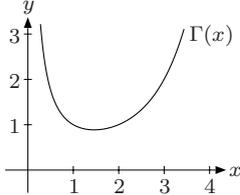

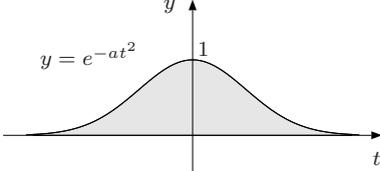

$$\frac{d}{dx} \int_a^b f(x, t) dt = \int_a^b f'_x(x, t) dt$$

“Differentiation under the integral sign”. a and b are independent of x .

9.51

$$\frac{d}{dx} \int_c^{\infty} f(x, t) dt = \int_c^{\infty} f'_x(x, t) dt$$

Valid for x in (a, b) if $f(x, t)$ and $f'_x(x, t)$ are continuous for all $t \geq c$ and all x in (a, b) , and $\int_c^{\infty} f(x, t) dt$ and $\int_c^{\infty} f'_x(x, t) dt$ converge uniformly on (a, b) .

- 9.52 $\frac{d}{dx} \int_{u(x)}^{v(x)} f(x, t) dt =$
 $f(x, v(x))v'(x) - f(x, u(x))u'(x) + \int_{u(x)}^{v(x)} f'_x(x, t) dt$ | *Leibniz's formula.*
- 9.53 $\Gamma(x) = \int_0^\infty e^{-t} t^{x-1} dt, \quad x > 0$ | *The gamma function.*
- 9.54  | *The graph of the gamma function. The minimum value is ≈ 0.8856 at $x \approx 1.4616$.*
- 9.55 $\Gamma(x+1) = x\Gamma(x)$ for all $x > 0$ | *The functional equation for the gamma function.*
- 9.56 $\Gamma(n) = (n-1)!$ when n is a positive integer. | *Follows immediately from the functional equation.*
- 9.57 $\int_{-\infty}^{+\infty} e^{-at^2} dt = \sqrt{\pi/a} \quad (a > 0)$ | *An important formula.*
- 9.58  | *According to (9.57) the shaded area is $\sqrt{\pi/a}$.*
- 9.59 $\int_0^\infty t^k e^{-at^2} dt = \frac{1}{2} a^{-(k+1)/2} \Gamma((k+1)/2)$ | *Valid for $a > 0, k > -1$.*
- 9.60 $\Gamma(x) = \sqrt{2\pi} x^{x-\frac{1}{2}} e^{-x} e^{\theta/12x}, \quad x > 0, \theta \in (0, 1)$ | *Stirling's formula.*
- 9.61 $B(p, q) = \int_0^1 u^{p-1} (1-u)^{q-1} du, \quad p, q > 0$ | *The beta function.*
- 9.62 $B(p, q) = \frac{\Gamma(p)\Gamma(q)}{\Gamma(p+q)}$ | *The relationship between the beta function and the gamma function.*

$$9.63 \quad \int_a^b f(x) dx \approx \frac{b-a}{2n} [f(x_0) + 2 \sum_{i=1}^{n-1} f(x_i) + f(x_n)]$$

The *trapezoid formula*.

$$x_i = a + i \frac{b-a}{n}, \\ i = 0, \dots, n.$$

9.64 If f is C^2 on $[a, b]$ and $|f''(x)| \leq M$ for all x in $[a, b]$, then $M(b-a)^3/12n^2$ is an upper bound on the error of approximation in (9.63).

Trapezoidal error estimate.

$$9.65 \quad \int_a^b f(x) dx \approx \frac{b-a}{6n} D, \text{ where } D = \\ f(x_0) + 4 \sum_{i=1}^n f(x_{2i-1}) + 2 \sum_{i=1}^{n-1} f(x_{2i}) + f(x_{2n})$$

Simpson's formula. The

points $x_j = a + j \frac{b-a}{2n}$,
 $j = 0, \dots, 2n$,
partition $[a, b]$ into $2n$
equal subintervals.

9.66 If f is C^4 on $[a, b]$ and $|f^{(4)}(x)| \leq M$ for all x in $[a, b]$, then $M(b-a)^5/180n^4$ is an upper bound on the error of approximation in (9.65).

Simpson's error estimate.

Multiple integrals

$$9.67 \quad \iint_R f(x, y) dx dy = \int_a^b \left(\int_c^d f(x, y) dy \right) dx \\ = \int_c^d \left(\int_a^b f(x, y) dx \right) dy$$

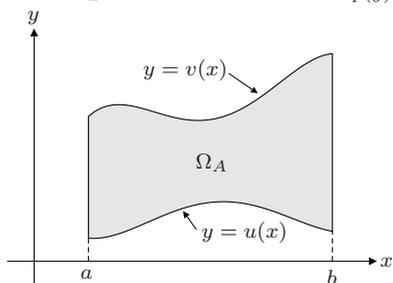

Definition of the *double integral* of $f(x, y)$ over a rectangle $R = [a, b] \times [c, d]$. (The fact that the two iterated integrals are equal for continuous functions, is *Fubini's theorem*.)

$$9.68 \quad \iint_{\Omega_A} f(x, y) dx dy = \int_a^b \left(\int_{u(x)}^{v(x)} f(x, y) dy \right) dx$$

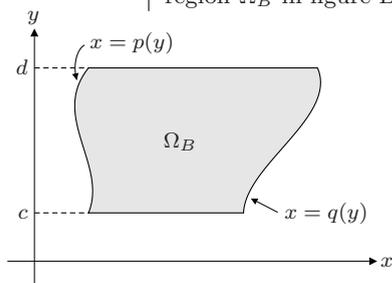

The double integral of a function $f(x, y)$ over the region Ω_A in figure A.

$$9.69 \quad \iint_{\Omega_B} f(x, y) dx dy = \int_c^d \left(\int_{p(y)}^{q(y)} f(x, y) dx \right) dy$$

The double integral of a function $f(x, y)$ over the region Ω_B in figure B.

A

B

$$9.70 \quad \begin{aligned} F''_{xy}(x, y) &= f(x, y), \quad (x, y) \in [a, b] \times [c, d] \Rightarrow \\ \int_c^d \left(\int_a^b f(x, y) dx \right) dy &= \\ &F(b, d) - F(a, d) - F(b, c) + F(a, c) \end{aligned}$$

An interesting result. $f(x, y)$ is a continuous function.

$$9.71 \quad \begin{aligned} \iint_A f(x, y) dx dy &= \\ \iint_{A'} f(g(u, v), h(u, v)) |J| du dv \end{aligned}$$

Change of variables in a double integral. $x = g(u, v)$, $y = h(u, v)$ is a one-to-one C^1 transformation of A' onto A , and the Jacobian determinant $J = \partial(g, h)/\partial(u, v)$ does not vanish in A' . f is continuous.

$$9.72 \quad \begin{aligned} \iiint \cdots \int_{\Omega} f(\mathbf{x}) dx_1 \cdots dx_{n-1} dx_n &= \\ \int_{a_n}^{b_n} \left(\int_{a_{n-1}}^{b_{n-1}} \cdots \left(\int_{a_1}^{b_1} f(\mathbf{x}) dx_1 \right) \cdots dx_{n-1} \right) dx_n \end{aligned}$$

The n -integral of f over an n -dimensional rectangle Ω . $\mathbf{x} = (x_1, \dots, x_n)$.

$$9.73 \quad \begin{aligned} \int \cdots \int_A f(\mathbf{x}) dx_1 \cdots dx_n &= \\ \int \cdots \int_{A'} f(g_1(\mathbf{u}), \dots, g_n(\mathbf{u})) |J| du_1 \cdots du_n \end{aligned}$$

Change of variables in the n -integral. $x_i = g_i(\mathbf{u})$, $i = 1, \dots, n$, is a one-to-one C^1 transformation of A' onto A , and the Jacobian determinant $J = \frac{\partial(g_1, \dots, g_n)}{\partial(u_1, \dots, u_n)}$ does not vanish in A' . f is continuous.

References

Most of these formulas can be found in any calculus text, e.g. Edwards and Penney (1998). For (9.67)–(9.73), see Marsden and Hoffman (1993), who have a precise treatment of multiple integrals. (Not all the required assumptions are spelled out in the subsection on multiple integrals.)

Chapter 10

Difference equations

10.1 $x_t = a_t x_{t-1} + b_t, \quad t = 1, 2, \dots$

A *first-order linear difference equation*.

10.2 $x_t = \left(\prod_{s=1}^t a_s\right)x_0 + \sum_{k=1}^t \left(\prod_{s=k+1}^t a_s\right)b_k$

The solution of (10.1) if we define the “empty” product $\prod_{s=t+1}^t a_s$ as 1.

10.3 $x_t = a^t x_0 + \sum_{k=1}^t a^{t-k} b_k, \quad t = 1, 2, \dots$

The solution of (10.1) when $a_t = a$, a constant.

10.4 • $x_t = Aa^t + \sum_{s=0}^{\infty} a^s b_{t-s}, \quad |a| < 1$

• $x_t = Aa^t - \sum_{s=1}^{\infty} \left(\frac{1}{a}\right)^s b_{t+s}, \quad |a| > 1$

The *backward* and *forward solutions* of (10.1), respectively, with $a_t = a$, and with A as an arbitrary constant.

10.5 $x_t = ax_{t-1} + b \Leftrightarrow x_t = a^t \left(x_0 - \frac{b}{1-a}\right) + \frac{b}{1-a}$

Equation (10.1) and its solution when $a_t = a \neq 1, b_t = b$.

10.6 (*) $x_t + a_1(t)x_{t-1} + \dots + a_n(t)x_{t-n} = b_t$

(**) $x_t + a_1(t)x_{t-1} + \dots + a_n(t)x_{t-n} = 0$

(*) is the *general linear inhomogeneous difference equation of order n* , and (**) is the associated *homogeneous equation*.

10.7 If $u_1(t), \dots, u_n(t)$ are linearly independent solutions of (10.6) (**), u_t^* is some particular solution of (10.6) (*), and C_1, \dots, C_n are arbitrary constants, then the general solution of (**) is

$$x_t = C_1 u_1(t) + \dots + C_n u_n(t)$$

and the general solution of (*) is

$$x_t = C_1 u_1(t) + \dots + C_n u_n(t) + u_t^*$$

The structure of the solutions of (10.6). (For linear independence, see (11.21).)

For $b \neq 0$, $x_t + ax_{t-1} + bx_{t-2} = 0$ has the solution:

- 10.8
- For $\frac{1}{4}a^2 - b > 0$: $x_t = C_1 m_1^t + C_2 m_2^t$,
where $m_{1,2} = -\frac{1}{2}a \pm \sqrt{\frac{1}{4}a^2 - b}$.
 - For $\frac{1}{4}a^2 - b = 0$: $x_t = (C_1 + C_2 t)(-a/2)^t$.
 - For $\frac{1}{4}a^2 - b < 0$: $x_t = Ar^t \cos(\theta t + \omega)$,
where $r = \sqrt{b}$ and $\cos \theta = -\frac{a}{2\sqrt{b}}$, $\theta \in [0, \pi]$.

The solutions of a homogeneous, linear second-order difference equation with constant coefficients a and b . C_1 , C_2 , and ω are arbitrary constants.

To find a particular solution of

$$(*) \quad x_t + ax_{t-1} + bx_{t-2} = c_t, \quad b \neq 0$$

use the following trial functions and determine the constants by using the method of undetermined coefficients:

- 10.9
- If $c_t = c$, try $u_t^* = A$.
 - If $c_t = ct + d$, try $u_t^* = At + B$.
 - If $c_t = t^n$, try $u_t^* = A_0 + A_1 t + \dots + A_n t^n$.
 - If $c_t = c^t$, try $u_t^* = Ac^t$.
 - If $c_t = \alpha \sin ct + \beta \cos ct$, try $u_t^* = A \sin ct + B \cos ct$.

If the function c_t is itself a solution of the homogeneous equation, multiply the trial solution by t . If this new trial function also satisfies the homogeneous equation, multiply the trial function by t again. (See Hildebrand (1968), Sec. 1.8 for the general procedure.)

10.10

$$(*) \quad x_t + a_1 x_{t-1} + \dots + a_n x_{t-n} = b_t$$

$$(**) \quad x_t + a_1 x_{t-1} + \dots + a_n x_{t-n} = 0$$

Linear difference equations with constant coefficients.

10.11

$$m^n + a_1 m^{n-1} + \dots + a_{n-1} m + a_n = 0$$

The *characteristic equation* of (10.10). Its roots are called *characteristic roots*.

Suppose the characteristic equation (10.11) has n different roots, $\lambda_1, \dots, \lambda_n$, and define

10.12

$$\theta_r = \frac{\lambda_r}{\prod_{\substack{1 \leq s \leq n \\ s \neq r}} (\lambda_r - \lambda_s)}, \quad r = 1, 2, \dots, n$$

Then a special solution of (10.10) (*) is given by

$$u_t^* = \sum_{r=1}^n \theta_r \sum_{i=0}^{\infty} \lambda_r^i b_{t-i}$$

The *backward* solution of (10.10) (*), valid if $|\lambda_r| < 1$ for $r = 1, \dots, n$.

To obtain n linearly independent solutions of (10.10) (**): Find all roots of the characteristic equation (10.11). Then:

- 10.13
- A real root m_i with multiplicity 1 gives rise to a solution m_i^t .
 - A real root m_j with multiplicity $p > 1$, gives rise to solutions $m_j^t, tm_j^t, \dots, t^{p-1}m_j^t$.
 - A pair of complex roots $m_k = \alpha + i\beta$, $\bar{m}_k = \alpha - i\beta$ with multiplicity 1, gives rise to the solutions $r^t \cos \theta t$, $r^t \sin \theta t$, where $r = \sqrt{\alpha^2 + \beta^2}$, and $\theta \in [0, \pi]$ satisfies $\cos \theta = \alpha/r$, $\sin \theta = \beta/r$.
 - A pair of complex roots $m_e = \lambda + i\mu$, $\bar{m}_e = \lambda - i\mu$ with multiplicity $q > 1$ gives rise to the solutions u , v , tu , tv , \dots , $t^{q-1}u$, $t^{q-1}v$, with $u = s^t \cos \varphi t$, $v = s^t \sin \varphi t$, where $s = \sqrt{\lambda^2 + \mu^2}$, and $\varphi \in [0, \pi]$ satisfies $\cos \varphi = \lambda/s$, and $\sin \varphi = \mu/s$.

A general method for finding n linearly independent solutions of (10.10) (**).

10.14 The equations in (10.10) are called (*globally asymptotically*) *stable* if any solution of the homogeneous equation (10.10) (**) approaches 0 as $t \rightarrow \infty$.

Definition of stability for a linear equation with constant coefficients.

10.15 The equations in (10.10) are stable if and only if all the roots of the characteristic equation (10.11) have moduli less than 1.

Stability criterion for (10.10).

$$\left| \begin{array}{c|c} 1 & a_n \\ \hline a_n & 1 \end{array} \right| > 0, \quad \left| \begin{array}{cc|cc} 1 & 0 & a_n & a_{n-1} \\ a_1 & 1 & 0 & a_n \\ \hline a_n & 0 & 1 & a_1 \\ a_{n-1} & a_n & 0 & 1 \end{array} \right| > 0, \dots,$$

10.16

$$\left| \begin{array}{cccc|cccc} 1 & 0 & \dots & 0 & a_n & a_{n-1} & \dots & a_1 \\ a_1 & 1 & \dots & 0 & 0 & a_n & \dots & a_2 \\ \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{n-1} & a_{n-2} & \dots & 1 & 0 & 0 & \dots & a_n \\ \hline a_n & 0 & \dots & 0 & 1 & a_1 & \dots & a_{n-1} \\ a_{n-1} & a_n & \dots & 0 & 0 & 1 & \dots & a_{n-2} \\ \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \ddots & \vdots \\ a_1 & a_2 & \dots & a_n & 0 & 0 & \dots & 1 \end{array} \right| > 0$$

A necessary and sufficient condition for all the roots of (10.11) to have moduli less than 1. (*Schur's theorem*.)

10.17 $x_t + a_1 x_{t-1} = b_t$ is stable $\iff |a_1| < 1$

Special case of (10.15) and (10.16).

- 10.27 The difference equation (10.22) with $\mathbf{A}(t) = \mathbf{A}$ is stable if and only if all the eigenvalues of \mathbf{A} have moduli less than 1. Characterization of stability of a linear system.
- 10.28 If all eigenvalues of $\mathbf{A} = (a_{ij})_{n \times n}$ have moduli less than 1, then every solution $\mathbf{x}(t)$ of
$$\mathbf{x}(t) = \mathbf{A}\mathbf{x}(t-1) + \mathbf{b}, \quad t = 1, 2, \dots$$
 converges to the vector $(\mathbf{I} - \mathbf{A})^{-1}\mathbf{b}$. The solution of an important equation.

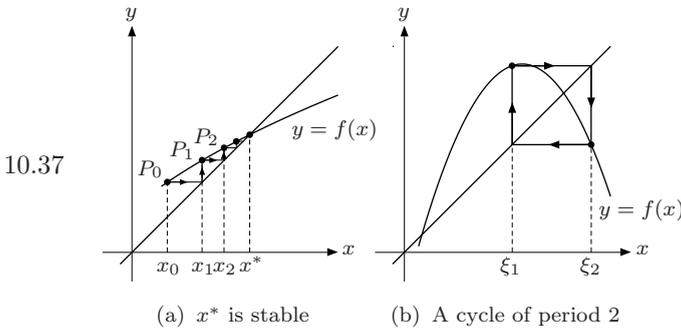

Stability of first-order nonlinear difference equations

- 10.29 $x_{t+1} = f(x_t), \quad t = 0, 1, 2, \dots$ A general first-order difference equation.
- 10.30 An *equilibrium state* of the difference equation (10.29) is a point x^* such that $f(x^*) = x^*$. x^* is a fixed point for f . If $x_0 = x^*$, then $x_t = x^*$ for all $t = 0, 1, 2, \dots$
- 10.31 An equilibrium state x^* of (10.29) is *locally asymptotically stable* if there exists a $\delta > 0$ such that, if $|x_0 - x^*| < \delta$ then $\lim_{t \rightarrow \infty} x_t = x^*$. A solution of (10.29) that starts sufficiently close to a locally asymptotically stable equilibrium x^* converges to x^* .
- An equilibrium state x^* is *unstable* if there is a $\delta > 0$ such that $|f(x) - x^*| > |x - x^*|$ for every x with $0 < |x - x^*| < \delta$. A solution that starts close to an unstable equilibrium x^* will move away from x^* , at least to begin with.
- 10.32 If x^* is an equilibrium state for equation (10.29) and f is C^1 in an open interval around x^* , then A simple criterion for local stability. See figure (10.37) (a).
- If $|f'(x^*)| < 1$, then x^* is locally asymptotically stable.
 - If $|f'(x^*)| > 1$, then x^* is unstable.
- 10.33 A *cycle* or *periodic solution* of $x_{t+1} = f(x_t)$ with minimal period $n > 0$ is a solution such that $x_{t+n} = x_t$ for some t , while $x_{t+k} \neq x_t$ for $k = 1, \dots, n-1$. A cycle will repeat itself indefinitely.
- 10.34 The equation $x_{t+1} = f(x_t)$ admits a cycle of period 2 if and only if there exist points ξ_1 and ξ_2 such that $f(\xi_1) = \xi_2$ and $f(\xi_2) = \xi_1$. ξ_1 and ξ_2 are fixed points of $F = f \circ f$. See figure (10.37) (b).

10.35 A period 2 cycle for $x_{t+1} = f(x_t)$ alternating between ξ_1 and ξ_2 is *locally asymptotically stable* if every solution starting close to ξ_1 (or equivalently ξ_2) converges to the cycle.

10.36 If f is C^1 and $x_{t+1} = f(x_t)$ admits a period 2 cycle ξ_1, ξ_2 then:

- If $|f'(\xi_1)f'(\xi_2)| < 1$, then the cycle is locally asymptotically stable.
- If $|f'(\xi_1)f'(\xi_2)| > 1$, then the cycle is unstable.

The cycle is locally asymptotically stable if ξ_1 and ξ_2 are locally asymptotically stable equilibria of the equation $y_{t+1} = f(f(y_t))$.

An easy consequence of (10.32). The cycle is *unstable* if ξ_1 or ξ_2 (and then both) is an unstable equilibrium of $y_{t+1} = f(f(y_t))$.

Illustrations of (10.32) and (10.34). In figure (a), the sequence x_0, x_1, x_2, \dots is a solution of (10.29), converging to the equilibrium x^* . The points $P_i = (x_i, x_{i+1})$ are the corresponding points on the graph of f .

Most of the formulas and results are found in e.g. Goldberg (1961), Gandolfo (1996), and Hildebrand (1968). For (10.19) and (10.20), see Farebrother (1973). For (10.29)–(10.36), see Sydsæter et al. (2005).

Chapter 11

Differential equations

First-order equations

11.1 $\dot{x}(t) = f(t) \iff x(t) = x(t_0) + \int_{t_0}^t f(\tau) d\tau$

A simple differential equation and its solution. $f(t)$ is a given function and $x(t)$ is the unknown function.

11.2 $\frac{dx}{dt} = f(t)g(x) \iff \int \frac{dx}{g(x)} = \int f(t) dt$
Evaluate the integrals. Solve the resulting implicit equation for $x = x(t)$.

A *separable* differential equation. If $g(a) = 0$, $x(t) \equiv a$ is a solution.

11.3 $\dot{x} = g(x/t)$ and $z = x/t \implies t \frac{dz}{dt} = g(z) - z$

A *projective* differential equation. The substitution $z = x/t$ leads to a separable equation for z .

11.4 The equation $\dot{x} = B(x - a)(x - b)$ has the solutions
$$x \equiv a, \quad x \equiv b, \quad x = a + \frac{b - a}{1 - Ce^{B(b-a)t}}$$

$a \neq b$. $a = 0$ gives the *logistic* equation. C is a constant.

11.5

- $\dot{x} + ax = b \iff x = Ce^{-at} + \frac{b}{a}$
- $\dot{x} + ax = b(t) \iff x = e^{-at}(C + \int b(t)e^{at} dt)$

Linear first-order differential equations with constant coefficient
 $a \neq 0$. C is a constant.

11.6 $\dot{x} + a(t)x = b(t) \iff$
$$x = e^{-\int a(t) dt} \left(C + \int e^{\int a(t) dt} b(t) dt \right)$$

General linear first-order differential equation.
 $a(t)$ and $b(t)$ are given.
 C is a constant.

$$11.7 \quad \dot{x} + a(t)x = b(t) \iff x(t) = x_0 e^{-\int_{t_0}^t a(\xi) d\xi} + \int_{t_0}^t b(\tau) e^{-\int_{\tau}^t a(\xi) d\xi} d\tau$$

Solution of (11.6) with given initial condition $x(t_0) = x_0$.

$$11.8 \quad \dot{x} + a(t)x = b(t)x^r \text{ has the solution } x(t) = e^{-A(t)} \left[C + (1-r) \int b(t) e^{(1-r)A(t)} dt \right]^{\frac{1}{1-r}}$$

where $A(t) = \int a(t) dt$.

Bernoulli's equation and its solution ($r \neq 1$). C is a constant. (If $r = 1$, the equation is separable.)

$$11.9 \quad \dot{x} = P(t) + Q(t)x + R(t)x^2$$

Riccati's equation. Not analytically solvable in general. The substitution $x = u + 1/z$ works if we know a particular solution $u = u(t)$.

The differential equation

$$11.10 \quad (*) \quad f(t, x) + g(t, x)\dot{x} = 0$$

is called *exact* if $f'_x(t, x) = g'_t(t, x)$. The solution $x = x(t)$ is then given implicitly by the equation $\int_{t_0}^t f(\tau, x) d\tau + \int_{x_0}^x g(t_0, \xi) d\xi = C$ for some constant C .

An *exact* equation and its solution.

A function $\beta(t, x)$ is an *integrating factor* for (*) in (11.10) if $\beta(t, x)f(t, x) + \beta(t, x)g(t, x)\dot{x} = 0$ is exact.

$$11.11 \quad \bullet \text{ If } (f'_x - g'_t)/g \text{ is a function of } t \text{ alone, then } \beta(t) = \exp[\int (f'_x - g'_t)/g dt] \text{ is an integrating factor.}$$

$$\bullet \text{ If } (g'_t - f'_x)/f \text{ is a function of } x \text{ alone, then } \beta(x) = \exp[\int (g'_t - f'_x)/f dx] \text{ is an integrating factor.}$$

Results which occasionally can be used to solve equation (*) in (11.10).

Consider the *initial value problem*

$$(*) \quad \dot{x} = F(t, x), \quad x(t_0) = x_0$$

where $F(t, x)$ and $F'_x(t, x)$ are continuous over the rectangle

$$11.12 \quad \Gamma = \{ (t, x) : |t - t_0| \leq a, |x - x_0| \leq b \}$$

Define

$$M = \max_{(t, x) \in \Gamma} |F(t, x)|, \quad r = \min(a, b/M)$$

Then (*) has a unique solution $x(t)$ on the open interval $(t_0 - r, t_0 + r)$, and $|x(t) - x_0| \leq b$ in this interval.

A (*local*) *existence and uniqueness theorem*.

Consider the initial value problem

$$\dot{x} = F(t, x), \quad x(t_0) = x_0$$

Suppose that $F(t, x)$ and $F'_x(t, x)$ are continuous for all (t, x) . Suppose too that there exist continuous functions $a(t)$ and $b(t)$ such that

$$(*) \quad |F(t, x)| \leq a(t)|x| + b(t) \quad \text{for all } (t, x)$$

11.13

Given an arbitrary point (t_0, x_0) , there exists a unique solution $x(t)$ of the initial value problem, defined on $(-\infty, \infty)$.

If $(*)$ is replaced by the condition

$$xF(t, x) \leq a(t)|x|^2 + b(t) \quad \text{for all } x \text{ and all } t \geq t_0$$

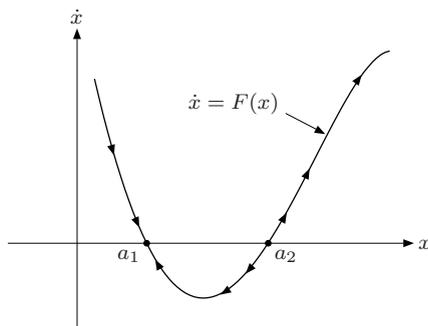

then the initial value problem has a unique solution defined on $[t_0, \infty)$.

Global existence and uniqueness.

11.14 $\dot{x} = F(x)$

An autonomous first-order differential equation. If $F(a) = 0$, then a is called an *equilibrium*.

11.15

If a solution x starts close to a_1 , then $x(t)$ will approach a_1 as t increases. On the other hand, if x starts close to a_2 (but not at a_2), then $x(t)$ will move away from a_2 as t increases. a_1 is a *locally stable* equilibrium state for $\dot{x} = F(x)$, whereas a_2 is *unstable*.

11.16

- $F(a) = 0$ and $F'(a) < 0 \Rightarrow a$ is a locally asymptotically stable equilibrium.
- $F(a) = 0$ and $F'(a) > 0 \Rightarrow a$ is an unstable equilibrium.

On stability of equilibrium for (11.14). The precise definitions of stability is given in (11.52).

11.17

If F is a C^1 function, every solution of the autonomous differential equation $\dot{x} = F(x)$ is either constant or strictly monotone on the interval where it is defined.

An interesting result.

Suppose that $x = x(t)$ is a solution of

$$\dot{x} = F(x)$$

- 11.18 where the function F is continuous. Suppose that $x(t)$ tends to a (finite) limit a as t tends to ∞ . Then a must be an equilibrium state for the equation—i.e. $F(a) = 0$.

A convergent solution converges to an equilibrium

Higher order equations

$$11.19 \quad \frac{d^n x}{dt^n} + a_1(t) \frac{d^{n-1} x}{dt^{n-1}} + \cdots + a_{n-1}(t) \frac{dx}{dt} + a_n(t)x = f(t)$$

The general linear n th-order differential equation. When $f(t)$ is not 0, the equation is called *inhomogeneous*.

$$11.20 \quad \frac{d^n x}{dt^n} + a_1(t) \frac{d^{n-1} x}{dt^{n-1}} + \cdots + a_{n-1}(t) \frac{dx}{dt} + a_n(t)x = 0$$

The *homogeneous equation* associated with (11.19).

The functions $u_1(t), \dots, u_m(t)$ are *linearly independent* if the equation

$$11.21 \quad C_1 u_1(t) + \cdots + C_m u_m(t) = 0$$

holds for all t only if the constants C_1, \dots, C_m are all 0. The functions are *linearly dependent* if they are not linearly independent.

Definition of linear independence and dependence.

If $u_1(t), \dots, u_n(t)$ are linearly independent solutions of the homogeneous equation (11.20) and $u^*(t)$ is some particular solution of the non-homogeneous equation (11.19), then the general solution of (11.20) is

$$11.22 \quad x(t) = C_1 u_1(t) + \cdots + C_n u_n(t)$$

and the general solution of (11.19) is

$$x(t) = C_1 u_1(t) + \cdots + C_n u_n(t) + u^*(t)$$

where C_1, \dots, C_n are arbitrary constants.

The structure of the solutions of (11.20) and (11.19). (Note that it is not possible, in general, to find analytic expressions for the required n solutions $u_1(t), \dots, u_n(t)$ of (11.20).)

$$11.27 \quad \frac{d^n x}{dt^n} + a_1 \frac{d^{n-1} x}{dt^{n-1}} + \cdots + a_{n-1} \frac{dx}{dt} + a_n x = f(t)$$

The general linear differential equation of order n with constant coefficients.

$$11.28 \quad \frac{d^n x}{dt^n} + a_1 \frac{d^{n-1} x}{dt^{n-1}} + \cdots + a_{n-1} \frac{dx}{dt} + a_n x = 0$$

The homogeneous equation associated with (11.27).

$$11.29 \quad r^n + a_1 r^{n-1} + \cdots + a_{n-1} r + a_n = 0$$

The characteristic equation associated with (11.27) and (11.28).

To obtain n linearly independent solutions of (11.28): Find all roots of (11.29).

- A real root r_i with multiplicity 1 gives rise to a solution $e^{r_i t}$.
- A real root r_j with multiplicity $p > 1$ gives rise to the solutions $e^{r_j t}, t e^{r_j t}, \dots, t^{p-1} e^{r_j t}$.
- 11.30 • A pair of complex roots $r_k = \alpha + i\beta$, $\bar{r}_k = \alpha - i\beta$ with multiplicity 1 gives rise to the solutions $e^{\alpha t} \cos \beta t$ and $e^{\alpha t} \sin \beta t$.
- A pair of complex roots $r_e = \lambda + i\mu$, $\bar{r}_e = \lambda - i\mu$ with multiplicity $q > 1$, gives rise to the solutions $u, v, tu, tv, \dots, t^{q-1} u, t^{q-1} v$, where $u = e^{\lambda t} \cos \mu t$ and $v = e^{\lambda t} \sin \mu t$.

General method for finding n linearly independent solutions of (11.28).

$$11.31 \quad x = x(t) = C_1 e^{r_1 t} + C_2 e^{r_2 t} + \cdots + C_n e^{r_n t}$$

The general solution of (11.28) if the roots r_1, \dots, r_n of (11.29) are all real and different.

- 11.32 Equation (11.28) (or (11.27)) is *stable (globally asymptotically stable)* if every solution of (11.28) tends to 0 as $t \rightarrow \infty$.

Definition of stability for linear equations with constant coefficients.

- 11.33 Equation (11.28) is stable \iff all the roots of the characteristic equation (11.29) have negative real parts.

Stability criterion for (11.28).

- 11.34 (11.28) is stable $\Rightarrow a_i > 0$ for all $i = 1, \dots, n$

Necessary condition for the stability of (11.28).

$$11.35 \quad \mathbf{A} = \begin{pmatrix} a_1 & a_3 & a_5 & \dots & 0 & 0 \\ a_0 & a_2 & a_4 & \dots & 0 & 0 \\ 0 & a_1 & a_3 & \dots & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & \dots & a_{n-1} & 0 \\ 0 & 0 & 0 & \dots & a_{n-2} & a_n \end{pmatrix}$$

A matrix associated with the coefficients in (11.28) (with $a_0 = 1$). The k th column of this matrix is $\dots a_{k+1} a_k a_{k-1} \dots$, where the element a_k is on the main diagonal. An element a_{k+j} with $k+j$ negative or greater than n , is set to 0.)

$$11.36 \quad (a_1), \quad \begin{pmatrix} a_1 & 0 \\ 1 & a_2 \end{pmatrix}, \quad \begin{pmatrix} a_1 & a_3 & 0 \\ 1 & a_2 & 0 \\ 0 & a_1 & a_3 \end{pmatrix}$$

The matrix \mathbf{A} in (11.35) for $n = 1, 2, 3$, with $a_0 = 1$.

$$11.37 \quad (11.28) \text{ is stable} \iff \begin{cases} \text{all leading principal} \\ \text{minors of } \mathbf{A} \text{ in (11.35)} \\ \text{(with } a_0 = 1) \text{ are positive.} \end{cases}$$

Routh-Hurwitz's stability conditions.

$$11.38 \quad \begin{aligned} &\bullet \dot{x} + a_1 x = f(t) \text{ is stable} \iff a_1 > 0 \\ &\bullet \ddot{x} + a_1 \dot{x} + a_2 x = f(t) \text{ is stable} \iff \begin{cases} a_1 > 0 \\ a_2 > 0 \end{cases} \\ &\bullet \dddot{x} + a_1 \ddot{x} + a_2 \dot{x} + a_3 x = f(t) \text{ is stable} \\ &\quad \iff a_1 > 0, a_3 > 0 \text{ and } a_1 a_2 > a_3 \end{aligned}$$

Special cases of (11.37). (It is easily seen that the conditions are equivalent to requiring that the leading principal minors of the matrices in (11.36) are all positive.)

Systems of differential equations

$$11.39 \quad \left. \begin{aligned} \frac{dx_1}{dt} &= f_1(t, x_1, \dots, x_n) \\ \dots & \\ \frac{dx_n}{dt} &= f_n(t, x_1, \dots, x_n) \end{aligned} \right\} \iff \dot{\mathbf{x}} = \mathbf{F}(t, \mathbf{x})$$

A *normal* (nonautonomous) system of differential equations. Here $\mathbf{x} = (x_1, \dots, x_n)$, $\dot{\mathbf{x}} = (\dot{x}_1, \dots, \dot{x}_n)$, and $\mathbf{F} = (f_1, \dots, f_n)$.

$$11.40 \quad \begin{aligned} \dot{x}_1 &= a_{11}(t)x_1 + \dots + a_{1n}(t)x_n + b_1(t) \\ \dots & \\ \dot{x}_n &= a_{n1}(t)x_1 + \dots + a_{nn}(t)x_n + b_n(t) \end{aligned}$$

A linear system of differential equations.

$$11.41 \quad \dot{\mathbf{x}} = \mathbf{A}(t)\mathbf{x} + \mathbf{b}(t), \quad \mathbf{x}(t_0) = \mathbf{x}^0$$

A matrix formulation of (11.40), with an initial condition. \mathbf{x} , $\dot{\mathbf{x}}$, and $\mathbf{b}(t)$ are column vectors and $\mathbf{A}(t) = (a_{ij}(t))_{n \times n}$.

$$11.42 \quad \dot{\mathbf{x}} = \mathbf{A}\mathbf{x}, \quad \mathbf{x}(t_0) = \mathbf{x}^0 \iff \mathbf{x} = e^{\mathbf{A}(t-t_0)}\mathbf{x}^0$$

The solution of (11.41) for $\mathbf{A}(t) = \mathbf{A}$, $\mathbf{b}(t) = \mathbf{0}$. (For matrix exponentials, see (19.30).)

Let $\mathbf{p}_j(t) = (p_{1j}(t), \dots, p_{nj}(t))'$, $j = 1, \dots, n$ be n linearly independent solutions of the homogeneous differential equation $\dot{\mathbf{x}} = \mathbf{A}(t)\mathbf{x}$, with $\mathbf{p}_j(t_0) = \mathbf{e}_j$, $j = 1, \dots, n$, where \mathbf{e}_j is the j th standard unit vector in \mathbb{R}^n . Then the

11.43 *resolvent* of the equation is the matrix

$$\mathbf{P}(t, t_0) = \begin{pmatrix} p_{11}(t) & \dots & p_{1n}(t) \\ \vdots & \ddots & \vdots \\ p_{n1}(t) & \dots & p_{nn}(t) \end{pmatrix}$$

The definition of the resolvent of a homogeneous linear differential equation. Note that $\mathbf{P}(t_0, t_0) = \mathbf{I}_n$.

$$11.44 \quad \mathbf{x} = \mathbf{P}(t, t_0)\mathbf{x}^0 + \int_{t_0}^t \mathbf{P}(t, s)\mathbf{b}(s) ds$$

The solution of (11.41).

If $\mathbf{P}(t, s)$ is the resolvent of

$$\dot{\mathbf{x}} = \mathbf{A}(t)\mathbf{x}$$

11.45 then $\mathbf{P}(s, t)'$ (the transpose of $\mathbf{P}(s, t)$) is the resolvent of

$$\dot{\mathbf{z}} = -\mathbf{A}(t)'\mathbf{z}$$

A useful fact.

Consider the n th-order differential equation

$$(*) \quad \frac{d^n x}{dt^n} = F\left(t, x, \frac{dx}{dt}, \dots, \frac{d^{n-1}x}{dt^{n-1}}\right)$$

By introducing new variables,

$$y_1 = x, \quad y_2 = \frac{dx}{dt}, \quad \dots, \quad y_n = \frac{d^{n-1}x}{dt^{n-1}}$$

11.46 one can transform (*) into a normal system:

$$\begin{aligned} \dot{y}_1 &= y_2 \\ \dot{y}_2 &= y_3 \\ &\dots\dots\dots \\ \dot{y}_{n-1} &= y_n \\ \dot{y}_n &= F(t, y_1, y_2, \dots, y_n) \end{aligned}$$

Any n th-order differential equation can be transformed into a normal system by introducing new unknowns. (A large class of systems of higher order differential equations can be transformed into a normal system by introducing new unknowns in a similar way.)

Consider the initial value problem

$$(*) \quad \dot{\mathbf{x}} = \mathbf{F}(t, \mathbf{x}), \quad \mathbf{x}(t_0) = \mathbf{x}^0$$

where $\mathbf{F} = (f_1, \dots, f_n)$ and its first-order partials w.r.t. x_1, \dots, x_n are continuous over the set

$$11.47 \quad \Gamma = \{ (t, \mathbf{x}) : |t - t_0| \leq a, \|\mathbf{x} - \mathbf{x}^0\| \leq b \}$$

Define

$$M = \max_{(t, \mathbf{x}) \in \Gamma} \|\mathbf{F}(t, \mathbf{x})\|, \quad r = \min(a, b/M)$$

Then $(*)$ has a unique solution $\mathbf{x}(t)$ on the open interval $(t_0 - r, t_0 + r)$, and $\|\mathbf{x}(t) - \mathbf{x}^0\| \leq b$ in this interval.

A (local) existence and uniqueness theorem.

Consider the initial value problem

$$(1) \quad \dot{\mathbf{x}} = \mathbf{F}(t, \mathbf{x}), \quad \mathbf{x}(t_0) = \mathbf{x}^0$$

where $\mathbf{F} = (f_1, \dots, f_n)$ and its first-order partials w.r.t. x_1, \dots, x_n are continuous for all (t, \mathbf{x}) . Assume, moreover, that there exist continuous functions $a(t)$ and $b(t)$ such that

$$11.48 \quad (2) \quad \|\mathbf{F}(t, \mathbf{x})\| \leq a(t)\|\mathbf{x}\| + b(t) \quad \text{for all } (t, \mathbf{x})$$

or

$$(3) \quad \mathbf{x} \cdot \mathbf{F}(t, \mathbf{x}) \leq a(t)\|\mathbf{x}\|^2 + b(t) \quad \text{for all } (t, \mathbf{x})$$

Then, given any point (t_0, \mathbf{x}^0) , there exists a unique solution $\mathbf{x}(t)$ of (1) defined on $(-\infty, \infty)$.

The inequality (2) is satisfied, in particular, if for all (t, \mathbf{x}) ,

$$(4) \quad \|\mathbf{F}'_{\mathbf{x}}(t, \mathbf{x})\| \leq c(t) \quad \text{for a continuous } c(t)$$

A global existence and uniqueness theorem. In (4) any matrix norm for $\mathbf{F}'_{\mathbf{x}}(t, \mathbf{x})$ can be used. (For matrix norms, see (19.26).)

Autonomous systems

$$11.49 \quad \begin{aligned} \dot{x}_1 &= f_1(x_1, \dots, x_n) \\ &\dots\dots\dots \\ \dot{x}_n &= f_n(x_1, \dots, x_n) \end{aligned}$$

An autonomous system of first-order differential equations.

11.50 $\mathbf{a} = (a_1, \dots, a_n)$ is an *equilibrium point* for the system (11.49) if $f_i(\mathbf{a}) = 0$, $i = 1, \dots, n$.

Definition of an equilibrium point for (11.49).

11.51 If $\mathbf{x}(t) = (x_1(t), \dots, x_n(t))$ is a solution of the system (11.49) on an interval I , then the set of points $\mathbf{x}(t)$ in \mathbb{R}^n trace out a curve in \mathbb{R}^n called a *trajectory* (or an *orbit*) for the system.

Definition of a trajectory (or an orbit), also called an integral curve.

An equilibrium point \mathbf{a} for (11.49) is (*locally stable*) if all solutions that start close to \mathbf{a} stay close to \mathbf{a} : For every $\varepsilon > 0$ there is a $\delta > 0$ such that if $\|\mathbf{x} - \mathbf{a}\| < \delta$, then there exists a solution $\varphi(t)$ of (11.49), defined for $t \geq 0$, with $\varphi(0) = \mathbf{x}$, that satisfies

11.52 $\|\varphi(t) - \mathbf{a}\| < \varepsilon$ for all $t > 0$

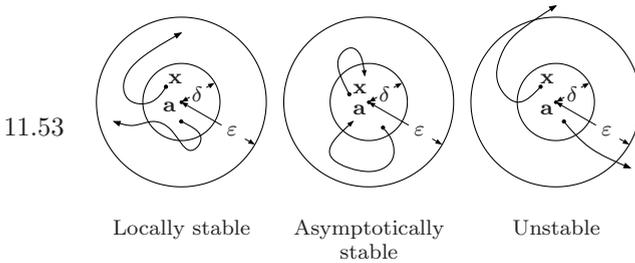

If \mathbf{a} is stable and there exists a $\delta' > 0$ such that

$$\|\mathbf{x} - \mathbf{a}\| < \delta' \implies \lim_{t \rightarrow \infty} \|\varphi(t) - \mathbf{a}\| = 0$$

then \mathbf{a} is (locally) *asymptotically stable*.

If \mathbf{a} is not stable, it is called *unstable*.

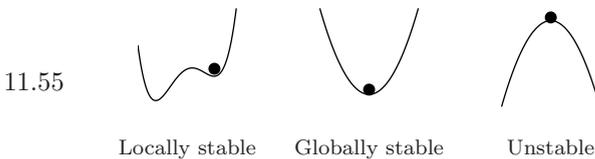

Definition of (local) stability and instability.

Illustrations of stability concepts. The curves with arrows attached are possible trajectories.

11.54 If every solution of (11.49), whatever its initial point, converges to a unique equilibrium point \mathbf{a} , then \mathbf{a} is *globally asymptotically stable*.

Global asymptotic stability.

Less technical illustrations of stability concepts.

11.56 Suppose $\mathbf{x}(t)$ is a solution of system (11.49) with $\mathbf{F} = (f_1, \dots, f_n)$ a C^1 function, and with $\mathbf{x}(t_0 + T) = \mathbf{x}(t_0)$ for some t_0 and some $T > 0$. Then $\mathbf{x}(t + T) = \mathbf{x}(t)$ for all t .

If a solution of (11.49) returns to its starting point after a length of time T , then it must be *periodic*, with period T .

Suppose that a solution $(x(t), y(t))$ of the system

$$\dot{x} = f(x, y), \quad \dot{y} = g(x, y)$$

- 11.57 stays within a compact region of the plane that contains no equilibrium point of the system. Its trajectory must then spiral into a closed curve that is itself the trajectory of a periodic solution of the system.

The *Poincaré–Bendixson theorem*.

Let \mathbf{a} be an equilibrium point for (11.49) and define

$$11.58 \quad \mathbf{A} = \begin{pmatrix} \frac{\partial f_1(\mathbf{a})}{\partial x_1} & \cdots & \frac{\partial f_1(\mathbf{a})}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_n(\mathbf{a})}{\partial x_1} & \cdots & \frac{\partial f_n(\mathbf{a})}{\partial x_n} \end{pmatrix}$$

If all the eigenvalues of \mathbf{A} have negative real parts, then \mathbf{a} is (locally) asymptotically stable.

If at least one eigenvalue has a positive real part, then \mathbf{a} is unstable.

A Liapunov theorem. The equilibrium point \mathbf{a} is called a *sink* if all the eigenvalues of \mathbf{A} have negative real parts. (It is called a *source* if all the eigenvalues of \mathbf{A} have positive real parts.)

A necessary and sufficient condition for all the eigenvalues of a real $n \times n$ matrix $\mathbf{A} = (a_{ij})$ to have negative real parts is that the following inequalities hold:

- 11.59
- For $n = 2$: $\operatorname{tr}(\mathbf{A}) < 0$ and $|\mathbf{A}| > 0$
 - For $n = 3$: $\operatorname{tr}(\mathbf{A}) < 0$, $|\mathbf{A}| < 0$, and

$$\begin{vmatrix} a_{22} + a_{33} & -a_{12} & -a_{13} \\ -a_{21} & a_{11} + a_{33} & -a_{23} \\ -a_{31} & -a_{32} & a_{11} + a_{22} \end{vmatrix} < 0$$

Useful characterizations of stable matrices of orders 2 and 3. (An $n \times n$ matrix is often called *stable* if all its eigenvalues have negative real parts.)

Let (a, b) be an equilibrium point for the system

$$\dot{x} = f(x, y), \quad \dot{y} = g(x, y)$$

and define

$$11.60 \quad \mathbf{A} = \begin{pmatrix} \frac{\partial f(a, b)}{\partial x} & \frac{\partial f(a, b)}{\partial y} \\ \frac{\partial g(a, b)}{\partial x} & \frac{\partial g(a, b)}{\partial y} \end{pmatrix}$$

Then, if $\operatorname{tr}(\mathbf{A}) < 0$ and $|\mathbf{A}| > 0$, (a, b) is locally asymptotically stable.

A special case of (11.58). Stability in terms of the signs of the trace and the determinant of \mathbf{A} , valid if $n = 2$.

- 11.61 An equilibrium point \mathbf{a} for (11.49) is called *hyperbolic* if the matrix \mathbf{A} in (11.58) has no eigenvalue with real part zero. Definition of a hyperbolic equilibrium point.
- 11.62 A hyperbolic equilibrium point for (11.49) is either unstable or asymptotically stable. An important result.
- Let (a, b) be an equilibrium point for the system
- $$\dot{x} = f(x, y), \quad \dot{y} = g(x, y)$$
- and define
- $$\mathbf{A}(x, y) = \begin{pmatrix} f'_1(x, y) & f'_2(x, y) \\ g'_1(x, y) & g'_2(x, y) \end{pmatrix}$$
- Assume that the following three conditions are satisfied:
- 11.63 (a) $\operatorname{tr}(\mathbf{A}(x, y)) = f'_1(x, y) + g'_2(x, y) < 0$
for all (x, y) in \mathbb{R}^2 Olech's theorem.
- (b) $|\mathbf{A}(x, y)| = \begin{vmatrix} f'_1(x, y) & f'_2(x, y) \\ g'_1(x, y) & g'_2(x, y) \end{vmatrix} > 0$
for all (x, y) in \mathbb{R}^2
- (c) $f'_1(x, y)g'_2(x, y) \neq 0$ for all (x, y) in \mathbb{R}^2 or
 $f'_2(x, y)g'_1(x, y) \neq 0$ for all (x, y) in \mathbb{R}^2
- Then (a, b) is globally asymptotically stable.
- 11.64 $V(\mathbf{x}) = V(x_1, \dots, x_n)$ is a Liapunov function for system (11.49) in an open set Ω containing an equilibrium point \mathbf{a} if Definition of a Liapunov function.
- $V(\mathbf{x}) > 0$ for all $\mathbf{x} \neq \mathbf{a}$ in Ω , $V(\mathbf{a}) = 0$, and
 - $\dot{V}(\mathbf{x}) = \sum_{i=1}^n \frac{\partial V(\mathbf{x})}{\partial x_i} \frac{dx_i}{dt} = \sum_{i=1}^n \frac{\partial V(\mathbf{x})}{\partial x_i} f_i(\mathbf{x}) \leq 0$
for all $\mathbf{x} \neq \mathbf{a}$ in Ω .
- 11.65 Let \mathbf{a} be an equilibrium point for (11.49) and suppose there exists a Liapunov function $V(\mathbf{x})$ for the system in an open set Ω containing \mathbf{a} . Then \mathbf{a} is a stable equilibrium point. If also A Liapunov theorem.
- $\dot{V}(\mathbf{x}) < 0$ for all $\mathbf{x} \neq \mathbf{a}$ in Ω
then \mathbf{a} is locally asymptotically stable.

The modified Lotka–Volterra model

$$\dot{x} = kx - axy - \varepsilon x^2, \quad \dot{y} = -hy + bxy - \delta y^2$$

has an asymptotically stable equilibrium

$$(x_0, y_0) = \left(\frac{ah + k\delta}{ab + \delta\varepsilon}, \frac{bk - h\varepsilon}{ab + \delta\varepsilon} \right)$$

11.66

The function $V(x, y) = H(x, y) - H(x_0, y_0)$, where

$$H(x, y) = b(x - x_0 \ln x) + a(y - y_0 \ln y)$$

is a Liapunov function for the system, with $\dot{V}(x, y) < 0$ except at the equilibrium point.

Example of the use of (11.65): x is the number of rabbits, y is the number of foxes. (a, b, h, k, δ , and ε are positive, $bk > h\varepsilon$.) $\varepsilon = \delta = 0$ gives the classical Lotka–Volterra model with $\dot{V} = 0$ everywhere, and integral curves that are closed curves around the equilibrium point.

Let (a, b) be an equilibrium point for the system

$$\dot{x} = f(x, y), \quad \dot{y} = g(x, y)$$

and define \mathbf{A} as the matrix in (11.60). If $|\mathbf{A}| < 0$, there exist (up to a translation of t) precisely two solutions $(x_1(t), y_1(t))$ and $(x_2(t), y_2(t))$ defined on an interval $[t_0, \infty)$ and converging to (a, b) . These solutions converge to (a, b) from opposite directions, and both are tangent to the line through (a, b) parallel to the eigenvector corresponding to the negative eigenvalue. Such an equilibrium is called a *saddle point*.

11.67

A *local saddle point theorem*. ($|\mathbf{A}| < 0$ if and only if the eigenvalues of \mathbf{A} are real and of opposite signs.) For a global version of this result, see Seierstad and Sydsæter (1987), Sec. 3.10, Theorem 19.)

Partial differential equations

Method for finding solutions of

$$(*) \quad P(x, y, z) \frac{\partial z}{\partial x} + Q(x, y, z) \frac{\partial z}{\partial y} = R(x, y, z)$$

- Find the solutions of the system

$$\frac{dy}{dx} = \frac{Q}{P}, \quad \frac{dz}{dx} = \frac{R}{P}$$

where x is the independent variable. If the solutions are given by $y = \varphi_1(x, C_1, C_2)$ and $z = \varphi_2(x, C_1, C_2)$, solve for C_1 and C_2 to obtain $C_1 = u(x, y, z)$ and $C_2 = v(x, y, z)$.

11.68

- If Φ is an arbitrary C^1 function of two variables, and at least one of the functions u and v contains z , then $z = z(x, y)$ defined implicitly by the equation

$$\Phi(u(x, y, z), v(x, y, z)) = 0,$$

is a solution of (*).

The general *quasilinear first-order partial differential equation* and a solution method. The method does not, in general, give *all* the solutions of (*). (See Zachmanoglou and Thoe (1986), Chap. II for more details.)

The following system of partial differential equations

$$\begin{aligned}
 & \frac{\partial z(\mathbf{x})}{\partial x_1} = f_1(\mathbf{x}, z(\mathbf{x})) \\
 & \frac{\partial z(\mathbf{x})}{\partial x_2} = f_2(\mathbf{x}, z(\mathbf{x})) \\
 & \dots\dots\dots \\
 & \frac{\partial z(\mathbf{x})}{\partial x_n} = f_n(\mathbf{x}, z(\mathbf{x}))
 \end{aligned}
 \tag{11.69}$$

in the unknown function $z(\mathbf{x}) = z(x_1, \dots, x_n)$, has a solution if and only if the $n \times n$ matrix of first-order partial derivatives of f_1, \dots, f_n w.r.t. x_1, \dots, x_n is symmetric.

Frobenius's theorem.
The functions f_1, \dots, f_n are C^1 .

Chapter 12

Topology in Euclidean space

12.1 $B(\mathbf{a}; r) = \{ \mathbf{x} : \|\mathbf{x} - \mathbf{a}\| < r \} \quad (r > 0)$

Definition of an *open* n -ball with radius r and center \mathbf{a} in \mathbb{R}^n . ($\|\cdot\|$ is defined in (18.13).)

• A point \mathbf{a} in $S \subset \mathbb{R}^n$ is an *interior point* of S if there exists an n -ball with center at \mathbf{a} , all of whose points belong to S .

12.2 • A point $\mathbf{b} \in \mathbb{R}^n$ (not necessarily in S) is a *boundary point* of S if every n -ball with center at \mathbf{b} contains at least one point in S and at least one point not in S .

Definition of interior points and boundary points.

A set S in \mathbb{R}^n is called

- 12.3
- *open* if all its points are interior points,
 - *closed* if $\mathbb{R}^n \setminus S$ is open,
 - *bounded* if there exists a number M such that $\|\mathbf{x}\| \leq M$ for all \mathbf{x} in S ,
 - *compact* if it is closed and bounded.

Important definitions.
 $\mathbb{R}^n \setminus S$
 $= \{ \mathbf{x} \in \mathbb{R}^n : \mathbf{x} \notin S \}.$

12.4 A set S in \mathbb{R}^n is closed if and only if it contains all its boundary points. The set \bar{S} consisting of S and all its boundary points is called the *closure* of S .

A useful characterization of closed sets, and a definition of the closure of a set.

12.5 A set S in \mathbb{R}^n is called a *neighborhood* of a point \mathbf{a} in \mathbb{R}^n if \mathbf{a} is an interior point of S .

Definition of a neighborhood.

12.6 A sequence $\{\mathbf{x}_k\}$ in \mathbb{R}^n *converges* to \mathbf{x} if for every $\varepsilon > 0$ there exists an integer N such that $\|\mathbf{x}_k - \mathbf{x}\| < \varepsilon$ for all $k \geq N$.

Convergence of a sequence in \mathbb{R}^n . If the sequence does not converge, it *diverges*.

12.7 A sequence $\{\mathbf{x}_k\}$ in \mathbb{R}^n is a *Cauchy sequence* if for every $\varepsilon > 0$ there exists an integer N such that $\|\mathbf{x}_j - \mathbf{x}_k\| < \varepsilon$ for all $j, k \geq N$.

Definition of a Cauchy sequence.

12.8	A sequence $\{\mathbf{x}_k\}$ in \mathbb{R}^n converges if and only if it is a Cauchy sequence.	<i>Cauchy's convergence criterion.</i>
12.9	A set S in \mathbb{R}^n is closed if and only if the limit $\mathbf{x} = \lim_k \mathbf{x}_k$ of each convergent sequence $\{\mathbf{x}_k\}$ of points in S also lies in S .	Characterization of a closed set.
12.10	Let $\{\mathbf{x}_k\}$ be a sequence in \mathbb{R}^n , and let $k_1 < k_2 < k_3 < \dots$ be an increasing sequence of integers. Then $\{\mathbf{x}_{k_j}\}_{j=1}^\infty$ is called a <i>subsequence</i> of $\{\mathbf{x}_k\}$.	Definition of a subsequence.
12.11	A set S in \mathbb{R}^n is compact if and only if every sequence of points in S has a subsequence that converges to a point in S .	Characterization of a compact set.
12.12	A collection \mathcal{U} of open sets is said to be an <i>open covering</i> of the set S if every point of S lies in at least one of the sets from \mathcal{U} . The set S has the <i>finite covering property</i> if whenever \mathcal{U} is an open covering of S , then a finite subcollection of the sets in \mathcal{U} covers S .	A useful concept.
12.13	A set S in \mathbb{R}^n is compact if and only if it has the finite covering property.	The Heine–Borel theorem.
12.14	<p>$f : M \subset \mathbb{R}^n \rightarrow \mathbb{R}$ is <i>continuous</i> at \mathbf{a} in M if for every $\varepsilon > 0$ there exists a $\delta > 0$ such that</p> $ f(\mathbf{x}) - f(\mathbf{a}) < \varepsilon$ <p>for all \mathbf{x} in M with $\ \mathbf{x} - \mathbf{a}\ < \delta$.</p>	Definition of a continuous function of n variables.
12.15	<p>The function $\mathbf{f} = (f_1, \dots, f_m) : M \subset \mathbb{R}^n \rightarrow \mathbb{R}^m$ is <i>continuous</i> at a point \mathbf{a} in M if for every $\varepsilon > 0$ there is a $\delta > 0$ such that</p> $\ \mathbf{f}(\mathbf{x}) - \mathbf{f}(\mathbf{a})\ < \varepsilon$ <p>for all \mathbf{x} in M with $\ \mathbf{x} - \mathbf{a}\ < \delta$.</p>	Definition of a continuous vector function of n variables.
12.16	<p>Let $\mathbf{f} = (f_1, \dots, f_m)$ be a function from $M \subset \mathbb{R}^n$ into \mathbb{R}^m, and let \mathbf{a} be a point in M. Then:</p> <ul style="list-style-type: none"> • \mathbf{f} is continuous at \mathbf{a} if and only if each f_i is continuous at \mathbf{a} according to definition (12.14). • \mathbf{f} is continuous at \mathbf{a} if and only if $\mathbf{f}(\mathbf{x}_k) \rightarrow \mathbf{f}(\mathbf{a})$ for every sequence $\{\mathbf{x}_k\}$ in M that converges to \mathbf{a}. 	Characterizations of a continuous vector function of n variables.

- 12.17 A function $\mathbf{f} : \mathbb{R}^n \rightarrow \mathbb{R}^m$ is continuous at each point \mathbf{x} in \mathbb{R}^n if and only if $\mathbf{f}^{-1}(T)$ is open (closed) for every open (closed) set T in \mathbb{R}^m . | Characterization of a continuous vector function from \mathbb{R}^n to \mathbb{R}^m .
- 12.18 If \mathbf{f} is a continuous function of \mathbb{R}^n into \mathbb{R}^m and M is a compact set in \mathbb{R}^n , then $\mathbf{f}(M)$ is compact. | Continuous functions map compact sets onto compact sets.
- 12.19 Given a set A in \mathbb{R}^n . The *relative ball* $B^A(\mathbf{a}; r)$ with radius r around $\mathbf{a} \in A$ is defined by the formula $B^A(\mathbf{a}; r) = B(\mathbf{a}; r) \cap A$. | Definition of a relative ball.
- 12.20 *Relative interior points, relative boundary points, relatively open sets, and relatively closed sets* are defined in the same way as the ordinary versions of these concepts, except that \mathbb{R}^n is replaced by a subset A , and balls by relative balls. | *Relative topology* concepts.
- 12.21
 - $U \subset A$ is relatively open in $A \subset \mathbb{R}^n$ if and only if there exists an open set V in \mathbb{R}^n such that $U = V \cap A$.
 - $F \subset A$ is relatively closed in $A \subset \mathbb{R}^n$ if and only if there exists a closed set H in \mathbb{R}^n such that $F = H \cap A$. | Characterizations of relatively open and relatively closed subsets of a set $A \subset \mathbb{R}^n$.
- 12.22 A function \mathbf{f} from $S \subset \mathbb{R}^n$ to \mathbb{R}^m is continuous if and only if either of the following conditions are satisfied:
 - $\mathbf{f}^{-1}(U)$ is relatively open in S for each open set U in \mathbb{R}^m .
 - $\mathbf{f}^{-1}(T)$ is relatively closed in S for each closed set T in \mathbb{R}^m . | A characterization of continuity that applies to functions whose domain is not the whole of \mathbb{R}^n .
- 12.23 A function $\mathbf{f} : M \subset \mathbb{R}^n \rightarrow \mathbb{R}^m$ is called *uniformly continuous* on the set $S \subset M$ if for each $\varepsilon > 0$ there exists a $\delta > 0$ (depending on ε but NOT on \mathbf{x} and \mathbf{y}) such that
$$\|f(\mathbf{x}) - f(\mathbf{y})\| < \varepsilon$$
for all \mathbf{x} and \mathbf{y} in S with $\|\mathbf{x} - \mathbf{y}\| < \delta$. | Definition of uniform continuity of a function from \mathbb{R}^n to \mathbb{R}^m .
- 12.24 If $\mathbf{f} : M \subset \mathbb{R}^n \rightarrow \mathbb{R}^m$ is continuous and the set $S \subset M$ is compact, then \mathbf{f} is uniformly continuous on S . | Continuous functions on compact sets are uniformly continuous.

- 12.25 Let $\{\mathbf{f}_n\}$ be a sequence of functions defined on a set $S \subset \mathbb{R}^n$ and with range in \mathbb{R}^m . The sequence $\{\mathbf{f}_n\}$ is said to *converge pointwise* to a function \mathbf{f} on S , if the sequence $\{\mathbf{f}_n(\mathbf{x})\}$ (in \mathbb{R}^m) converges to $\mathbf{f}(\mathbf{x})$ for each \mathbf{x} in S .
Definition of (point-wise) convergence of a sequence of functions.
- 12.26 A sequence $\{\mathbf{f}_n\}$ of functions defined on a set $S \subset \mathbb{R}^n$ and with range in \mathbb{R}^m , is said to *converge uniformly* to a function \mathbf{f} on S , if for each $\varepsilon > 0$ there is a natural number $N(\varepsilon)$ (depending on ε but NOT on \mathbf{x}) such that

$$\|\mathbf{f}_n(\mathbf{x}) - \mathbf{f}(\mathbf{x})\| < \varepsilon$$
for all $n \geq N(\varepsilon)$ and all \mathbf{x} in S .
Definition of uniform convergence of a sequence of functions.
- 12.27 A *correspondence* F from a set A to a set B is a rule that maps each x in A to a subset $F(x)$ of B . The *graph* of F is the set

$$\text{graph}(F) = \{(a, b) \in A \times B : b \in F(a)\}$$

Definition of a correspondence and its graph.
- 12.28 The correspondence $\mathbf{F} : X \subset \mathbb{R}^n \rightarrow \mathbb{R}^m$ has a *closed graph* if for every pair of convergent sequences $\{\mathbf{x}_k\}$ in X and $\{\mathbf{y}_k\}$ in \mathbb{R}^m with $\mathbf{y}_k \in \mathbf{F}(\mathbf{x}_k)$ and $\lim_k \mathbf{x}_k = \mathbf{x} \in X$, the limit $\lim_k \mathbf{y}_k$ belongs to $\mathbf{F}(\mathbf{x})$.
Thus \mathbf{F} has a closed graph if and only if $\text{graph}(\mathbf{F})$ is a relatively closed subset of the set $X \times \mathbb{R}^m \subset \mathbb{R}^n \times \mathbb{R}^m$.
Definition of a correspondence with a *closed graph*.
- 12.29 The correspondence $\mathbf{F} : X \subset \mathbb{R}^n \rightarrow \mathbb{R}^m$ is said to be *lower hemicontinuous* at \mathbf{x}^0 if, for each \mathbf{y}^0 in $\mathbf{F}(\mathbf{x}^0)$ and each neighborhood U of \mathbf{y}^0 , there exists a neighborhood N of \mathbf{x}^0 such that $\mathbf{F}(\mathbf{x}) \cap U \neq \emptyset$ for all \mathbf{x} in $N \cap X$.
Definition of lower hemicontinuity of a correspondence.
- 12.30 The correspondence $\mathbf{F} : X \subset \mathbb{R}^n \rightarrow \mathbb{R}^m$ is said to be *upper hemicontinuous* at \mathbf{x}^0 if for every open set U that contains $\mathbf{F}(\mathbf{x}^0)$, there exists a neighborhood N of \mathbf{x}^0 such that $\mathbf{F}(\mathbf{x}) \subset U$ for all x in $N \cap X$.
Definition of upper hemicontinuity of a correspondence.
- 12.31 Let $\mathbf{F} : X \subset \mathbb{R}^n \rightarrow K \subset \mathbb{R}^m$ be a correspondence where K is compact. Suppose that for every $\mathbf{x} \in X$ the set $\mathbf{F}(\mathbf{x})$ is a closed subset of K . Then \mathbf{F} has a closed graph if and only if \mathbf{F} is upper hemicontinuous.
An interesting result.

Infimum and supremum

- Any non-empty set S of real numbers that is bounded above has a *least upper bound* b^* , i.e. b^* is an upper bound for S and $b^* \leq b$ for every upper bound b of S . b^* is called the *supremum* of S , and we write $b^* = \sup S$.
- Any non-empty set S of real numbers that is bounded below has a *greatest lower bound* a^* , i.e. a^* is a lower bound for S and $a^* \geq a$ for every lower bound a of S . a^* is called the *infimum* of S , and we write $a^* = \inf S$.

The *principle of least upper bound and greatest lower bound* for sets of real numbers. If S is not bounded above, we write $\sup S = \infty$, and if S is not bounded below, we write $\inf S = -\infty$. One usually defines $\sup \emptyset = -\infty$ and $\inf \emptyset = \infty$.

$$12.32 \quad \inf_{\mathbf{x} \in B} f(\mathbf{x}) = \inf\{f(\mathbf{x}) : \mathbf{x} \in B\}$$

$$\sup_{\mathbf{x} \in B} f(\mathbf{x}) = \sup\{f(\mathbf{x}) : \mathbf{x} \in B\}$$

Definition of infimum and supremum of a real valued function defined on a set B in \mathbb{R}^n .

$$12.33 \quad \inf_{\mathbf{x} \in B} (f(\mathbf{x}) + g(\mathbf{x})) \geq \inf_{\mathbf{x} \in B} f(\mathbf{x}) + \inf_{\mathbf{x} \in B} g(\mathbf{x})$$

$$12.34 \quad \sup_{\mathbf{x} \in B} (f(\mathbf{x}) + g(\mathbf{x})) \leq \sup_{\mathbf{x} \in B} f(\mathbf{x}) + \sup_{\mathbf{x} \in B} g(\mathbf{x})$$

Results about sup and inf.

$$12.35 \quad \inf_{\mathbf{x} \in B} (\lambda f(\mathbf{x})) = \lambda \inf_{\mathbf{x} \in B} f(\mathbf{x}) \quad \text{if } \lambda > 0$$

$$\sup_{\mathbf{x} \in B} (\lambda f(\mathbf{x})) = \lambda \sup_{\mathbf{x} \in B} f(\mathbf{x}) \quad \text{if } \lambda > 0$$

λ is a real number.

$$12.36 \quad \sup_{\mathbf{x} \in B} (-f(\mathbf{x})) = - \inf_{\mathbf{x} \in B} f(\mathbf{x})$$

$$\inf_{\mathbf{x} \in B} (-f(\mathbf{x})) = - \sup_{\mathbf{x} \in B} f(\mathbf{x})$$

$$12.37 \quad \sup_{(\mathbf{x}, \mathbf{y}) \in A \times B} f(\mathbf{x}, \mathbf{y}) = \sup_{\mathbf{x} \in A} (\sup_{\mathbf{y} \in B} f(\mathbf{x}, \mathbf{y}))$$

$$A \times B = \{(\mathbf{x}, \mathbf{y}) : \mathbf{x} \in A \wedge \mathbf{y} \in B\}$$

$$12.38 \quad \varliminf_{\mathbf{x} \rightarrow \mathbf{x}^0} f(\mathbf{x}) = \lim_{r \rightarrow 0} (\inf\{f(\mathbf{x}) : 0 < \|\mathbf{x} - \mathbf{x}^0\| < r, \mathbf{x} \in M\})$$

$$\varlimsup_{\mathbf{x} \rightarrow \mathbf{x}^0} f(\mathbf{x}) = \lim_{r \rightarrow 0} (\sup\{f(\mathbf{x}) : 0 < \|\mathbf{x} - \mathbf{x}^0\| < r, \mathbf{x} \in M\})$$

Definition of \varliminf and \varlimsup . $\varliminf = \liminf$ and $\varlimsup = \limsup$. f is defined on $M \subset \mathbb{R}^n$ and \mathbf{x}^0 is in the closure of $M \setminus \{\mathbf{x}^0\}$.

$$12.39 \quad \varliminf (f + g) \geq \varliminf f + \varliminf g$$

$$\varlimsup (f + g) \leq \varlimsup f + \varlimsup g$$

The inequalities are valid if the right hand sides are defined.

$$12.40 \quad \underline{\lim} f \leq \overline{\lim} f$$

Results on \liminf and \limsup .

$$12.41 \quad \underline{\lim} f = -\overline{\lim}(-f), \quad \overline{\lim} f = -\underline{\lim}(-f)$$

Let f be a real valued function defined on the interval $[t_0, \infty)$. Then we define:

$$12.42 \quad \begin{aligned} \bullet \quad \underline{\lim}_{t \rightarrow \infty} f(t) &= \lim_{t \rightarrow \infty} \inf\{f(s) : s \in [t_0, \infty)\} \\ \bullet \quad \overline{\lim}_{t \rightarrow \infty} f(t) &= \lim_{t \rightarrow \infty} \sup\{f(s) : s \in [t_0, \infty)\} \end{aligned}$$

Definition of $\underline{\lim}_{t \rightarrow \infty}$ and $\overline{\lim}_{t \rightarrow \infty}$. Formulas (12.39)–(12.41) are still valid.

$$12.43 \quad \bullet \quad \underline{\lim}_{t \rightarrow \infty} f(t) \geq a \Leftrightarrow \begin{cases} \text{For each } \varepsilon > 0 \text{ there is a} \\ t' \text{ such that } f(t) \geq a - \varepsilon \\ \text{for all } t \geq t'. \end{cases}$$

$$\bullet \quad \overline{\lim}_{t \rightarrow \infty} f(t) \geq a \Leftrightarrow \begin{cases} \text{For each } \varepsilon > 0 \text{ and each} \\ t' \text{ there is a } t \geq t' \text{ such} \\ \text{that } f(t) \geq a - \varepsilon \text{ for all} \\ t \geq t'. \end{cases}$$

Basic facts.

References

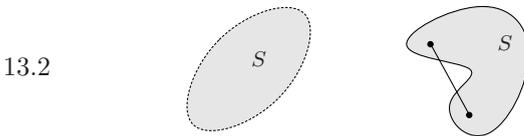

Bartle (1982), Marsden and Hoffman (1993), and Rudin (1982) are good references for standard topological results. For correspondences and their properties, see Hildenbrand and Kirman (1976) or Hildenbrand (1974).

Chapter 13

Convexity

13.1 A set S in \mathbb{R}^n is *convex* if
 $\mathbf{x}, \mathbf{y} \in S$ and $\lambda \in [0, 1] \Rightarrow \lambda\mathbf{x} + (1 - \lambda)\mathbf{y} \in S$

Definition of a convex set. The empty set is, by definition, convex.

The first set is convex, while the second is not convex.

13.3 If S and T are convex sets in \mathbb{R}^n , then

- $S \cap T = \{\mathbf{x} : \mathbf{x} \in S \text{ and } \mathbf{x} \in T\}$ is convex
- $aS + bT = \{a\mathbf{s} + b\mathbf{t} : \mathbf{s} \in S, \mathbf{t} \in T\}$ is convex

Properties of convex sets. (a and b are real numbers.)

13.4 Any vector $\mathbf{x} = \lambda_1\mathbf{x}_1 + \dots + \lambda_m\mathbf{x}_m$, where $\lambda_i \geq 0$ for $i = 1, \dots, m$ and $\sum_{i=1}^m \lambda_i = 1$, is called a *convex combination* of the vectors $\mathbf{x}_1, \dots, \mathbf{x}_m$ in \mathbb{R}^n .

Definition of a convex combination of vectors.

13.5 $\text{co}(S) = \left\{ \begin{array}{l} \text{the set of all convex combinations of} \\ \text{finitely many vectors in } S. \end{array} \right.$

$\text{co}(S)$ is the *convex hull* of a set S in \mathbb{R}^n .

If S is the unshaded set, then $\text{co}(S)$ includes the shaded parts in addition.

13.7 $\text{co}(S)$ is the smallest convex set containing S .

A useful characterization of the convex hull.

13.8 If $S \subset \mathbb{R}^n$ and $\mathbf{x} \in \text{co}(S)$, then \mathbf{x} is a convex combination of at most $n + 1$ points in S .

Carathéodory's theorem.

13.9 \mathbf{z} is an *extreme point* of a convex set S if $\mathbf{z} \in S$ and there are no \mathbf{x} and \mathbf{y} in S and λ in $(0, 1)$ such that $\mathbf{x} \neq \mathbf{y}$ and $\mathbf{z} = \lambda\mathbf{x} + (1 - \lambda)\mathbf{y}$.

Definition of an extreme point.

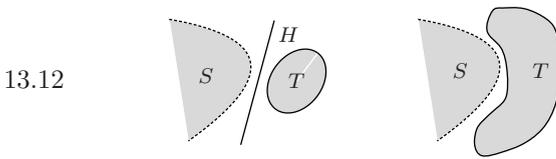

13.10 Let S be a compact, convex set in \mathbb{R}^n . Then S is the convex hull of its extreme points.

Krein–Milman’s theorem.

13.11 Let S and T be two disjoint non-empty convex sets in \mathbb{R}^n . Then S and T can be separated by a hyperplane, i.e. there exists a non-zero vector \mathbf{a} such that

Minkowski’s separation theorem. A hyperplane $\{\mathbf{x} : \mathbf{a} \cdot \mathbf{x} = A\}$, with $\mathbf{a} \cdot \mathbf{x} \leq A \leq \mathbf{a} \cdot \mathbf{y}$ for all \mathbf{x} in S and all \mathbf{y} in T , is called *separating*.

$$\mathbf{a} \cdot \mathbf{x} \leq \mathbf{a} \cdot \mathbf{y} \quad \text{for all } \mathbf{x} \text{ in } S \text{ and all } \mathbf{y} \text{ in } T$$

In the first figure S and T are (strictly) separated by H . In the second, S and T cannot be separated by a hyperplane.

13.13 Let S be a convex set in \mathbb{R}^n with interior points and let T be a convex set in \mathbb{R}^n such that no point in $S \cap T$ (if there are any) is an interior point of S . Then S and T can be separated by a hyperplane, i.e. there exists a vector $\mathbf{a} \neq \mathbf{0}$ such that

A general separation theorem in \mathbb{R}^n .

$$\mathbf{a} \cdot \mathbf{x} \leq \mathbf{a} \cdot \mathbf{y} \quad \text{for all } \mathbf{x} \text{ in } S \text{ and all } \mathbf{y} \text{ in } T.$$

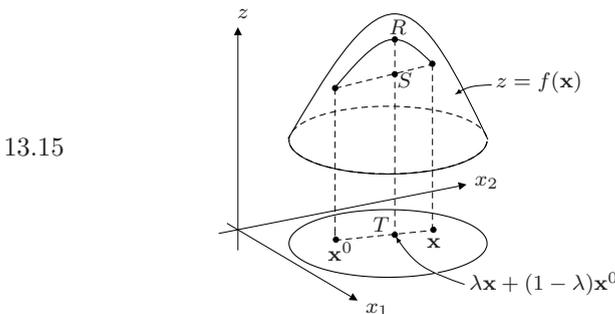

Concave and convex functions

13.14 $f(\mathbf{x}) = f(x_1, \dots, x_n)$ defined on a convex set S in \mathbb{R}^n is *concave* on S if

To define a *convex* function, reverse the inequality. Equivalently, f is convex if and only if $-f$ is concave.

$$f(\lambda \mathbf{x} + (1 - \lambda)\mathbf{x}^0) \geq \lambda f(\mathbf{x}) + (1 - \lambda)f(\mathbf{x}^0)$$

for all \mathbf{x}, \mathbf{x}^0 in S and all λ in $(0, 1)$.

The function $f(\mathbf{x})$ is (strictly) concave. $TR = f(\lambda \mathbf{x} + (1 - \lambda)\mathbf{x}^0) \geq TS = \lambda f(\mathbf{x}) + (1 - \lambda)f(\mathbf{x}^0)$. (TR and TS are the heights of R and S above the \mathbf{x} -plane. The heights are negative if the points are below the \mathbf{x} -plane.)

13.16 $f(\mathbf{x})$ is *strictly concave* if $f(\mathbf{x})$ is concave and the inequality \geq in (13.14) is strict for $\mathbf{x} \neq \mathbf{x}^0$.

Definition of a strictly concave function. For strict convexity, reverse the inequality.

13.17 If $f(\mathbf{x})$, defined on the convex set S in \mathbb{R}^n , is concave (convex), then $f(\mathbf{x})$ is continuous at each interior point of S .

On the continuity of concave and convex functions.

- If $f(\mathbf{x})$ and $g(\mathbf{x})$ are concave (convex) and a and b are nonnegative numbers, then $af(\mathbf{x}) + bg(\mathbf{x})$ is concave (convex).
 - If $f(\mathbf{x})$ is concave and $F(u)$ is concave and increasing, then $U(\mathbf{x}) = F(f(\mathbf{x}))$ is concave.
- 13.18
- If $f(\mathbf{x}) = \mathbf{a} \cdot \mathbf{x} + b$ and $F(u)$ is concave, then $U(\mathbf{x}) = F(f(\mathbf{x}))$ is concave.
 - If $f(\mathbf{x})$ is convex and $F(u)$ is convex and increasing, then $U(\mathbf{x}) = F(f(\mathbf{x}))$ is convex.
 - If $f(\mathbf{x}) = \mathbf{a} \cdot \mathbf{x} + b$ and $F(u)$ is convex, then $U(\mathbf{x}) = F(f(\mathbf{x}))$ is convex.

Properties of concave and convex functions.

A C^1 function $f(\mathbf{x})$ is concave on an open, convex set S of \mathbb{R}^n if and only if

$$13.19 \quad f(\mathbf{x}) - f(\mathbf{x}^0) \leq \sum_{i=1}^n \frac{\partial f(\mathbf{x}^0)}{\partial x_i} (x_i - x_i^0)$$

or, equivalently,

$$f(\mathbf{x}) - f(\mathbf{x}^0) \leq \nabla f(\mathbf{x}^0) \cdot (\mathbf{x} - \mathbf{x}^0)$$

for all \mathbf{x} and \mathbf{x}^0 in S .

Concavity for C^1 functions. For convexity, reverse the inequalities.

13.20 A C^1 function $f(\mathbf{x})$ is strictly concave on an open, convex set S in \mathbb{R}^n if and only if the inequalities in (13.19) are strict for $\mathbf{x} \neq \mathbf{x}^0$.

Strict concavity for C^1 functions. For strict convexity, reverse the inequalities.

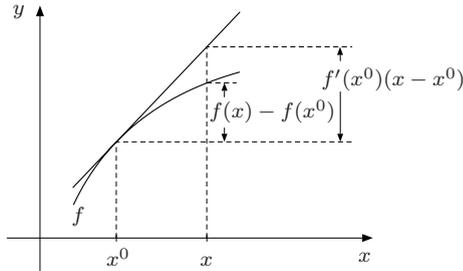

13.21 A C^1 function $f(x)$ is concave on an open interval I if and only if

$$f(x) - f(x^0) \leq f'(x^0)(x - x^0)$$

for all x and x^0 in I .

One-variable version of (13.19).

13.22

Geometric interpretation of (13.21). The C^1 function f is concave if and only if the graph of f is below the tangent at any point. (In the figure, f is actually strictly concave.)

A C^1 function $f(x, y)$ is concave on an open, convex set S in the (x, y) -plane if and only if

$$13.23 \quad \begin{aligned} f(x, y) - f(x^0, y^0) \\ \leq f'_1(x^0, y^0)(x - x^0) + f'_2(x^0, y^0)(y - y^0) \end{aligned}$$

for all $(x, y), (x^0, y^0)$ in S .

Two-variable version of (13.19).

$$13.24 \quad \mathbf{f}''(\mathbf{x}) = \begin{pmatrix} f''_{11}(\mathbf{x}) & f''_{12}(\mathbf{x}) & \cdots & f''_{1n}(\mathbf{x}) \\ f''_{21}(\mathbf{x}) & f''_{22}(\mathbf{x}) & \cdots & f''_{2n}(\mathbf{x}) \\ \vdots & \vdots & \ddots & \vdots \\ f''_{n1}(\mathbf{x}) & f''_{n2}(\mathbf{x}) & \cdots & f''_{nn}(\mathbf{x}) \end{pmatrix}$$

The *Hessian matrix* of f at \mathbf{x} . If f is C^2 , then the Hessian is symmetric.

The principal minors $\Delta_r(\mathbf{x})$ of order r in the Hessian matrix $\mathbf{f}''(\mathbf{x})$ are the determinants of the sub-matrices obtained by deleting $n - r$ arbitrary rows and then deleting the $n - r$ columns having the same numbers.

13.25

The principal minors of the Hessian. (See also (20.15).)

A C^2 function $f(\mathbf{x})$ is concave on an open, convex set S in \mathbb{R}^n if and only if for all \mathbf{x} in S and for all Δ_r ,

13.26

$$(-1)^r \Delta_r(\mathbf{x}) \geq 0 \quad \text{for } r = 1, \dots, n$$

Concavity for C^2 functions.

A C^2 function $f(\mathbf{x})$ is convex on an open, convex set S in \mathbb{R}^n if and only if for all \mathbf{x} in S and for all Δ_r ,

13.27

$$\Delta_r(\mathbf{x}) \geq 0 \quad \text{for } r = 1, \dots, n$$

Convexity for C^2 functions.

$$13.28 \quad D_r(\mathbf{x}) = \begin{vmatrix} f''_{11}(\mathbf{x}) & f''_{12}(\mathbf{x}) & \cdots & f''_{1r}(\mathbf{x}) \\ f''_{21}(\mathbf{x}) & f''_{22}(\mathbf{x}) & \cdots & f''_{2r}(\mathbf{x}) \\ \vdots & \vdots & \ddots & \vdots \\ f''_{r1}(\mathbf{x}) & f''_{r2}(\mathbf{x}) & \cdots & f''_{rr}(\mathbf{x}) \end{vmatrix}$$

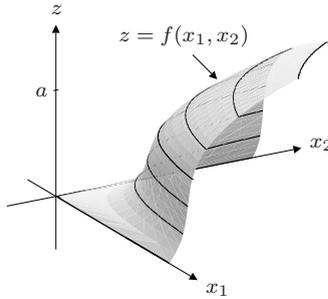

The leading principal minors of the Hessian matrix of f at \mathbf{x} , where $r = 1, 2, \dots, n$.

- 13.29 A C^2 function $f(\mathbf{x})$ is strictly concave on an open, convex set S in \mathbb{R}^n if for all $\mathbf{x} \in S$,
 $(-1)^r D_r(\mathbf{x}) > 0$ for $r = 1, \dots, n$
- Sufficient (but NOT necessary) conditions for strict concavity for C^2 functions.
- 13.30 A C^2 function $f(\mathbf{x})$ is strictly convex on an open, convex set S in \mathbb{R}^n if for all $\mathbf{x} \in S$,
 $D_r(\mathbf{x}) > 0$ for $r = 1, \dots, n$
- Sufficient (but NOT necessary) conditions for strict convexity for C^2 functions.
- Suppose $f(x)$ is a C^2 function on an open interval I . Then:
- 13.31
- $f(x)$ is concave on $I \Leftrightarrow f''(x) \leq 0$ for all x in I
 - $f(x)$ is convex on $I \Leftrightarrow f''(x) \geq 0$ for all x in I
 - $f''(x) < 0$ for all x in $I \Rightarrow f(x)$ is strictly concave on I
 - $f''(x) > 0$ for all x in $I \Rightarrow f(x)$ is strictly convex on I
- One-variable versions of (13.26), (13.27), (13.29), and (13.30). The implication arrows CAN-NOT be replaced by equivalence arrows. ($f(x) = -x^4$ is strictly concave, but $f''(0) = 0$. $f(x) = x^4$ is strictly convex, but $f''(0) = 0$.)
- 13.32 A C^2 function $f(x, y)$ is concave on an open, convex set S in the (x, y) -plane if and only if
 $f''_{11}(x, y) \leq 0$, $f''_{22}(x, y) \leq 0$ and
 $f''_{11}(x, y)f''_{22}(x, y) - (f''_{12}(x, y))^2 \geq 0$
for all (x, y) in S .
- Two-variable version of (13.26). For convexity of C^2 functions, reverse the first two inequalities.
- 13.33 A C^2 function $f(x, y)$ is strictly concave on an open, convex set S in the (x, y) -plane if (but NOT only if)
 $f''_{11}(x, y) < 0$ and
 $f''_{11}(x, y)f''_{22}(x, y) - (f''_{12}(x, y))^2 > 0$
for all (x, y) in S .
- Two-variable version of (13.29). (Note that the two inequalities imply $f''_{22}(x, y) < 0$.) For strict convexity, reverse the first inequality.

Quasiconcave and quasiconvex functions

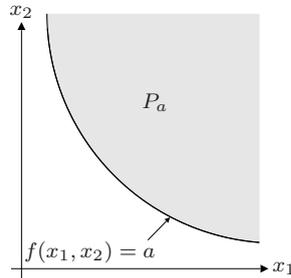

- 13.34 $f(\mathbf{x})$ is *quasiconcave* on a convex set $S \subset \mathbb{R}^n$ if the (*upper*) *level set*
 $P_a = \{\mathbf{x} \in S : f(\mathbf{x}) \geq a\}$
is convex for each real number a .
- Definition of a quasiconcave function. (Upper level sets are also called *upper contour sets*.)

13.35

A typical example of a quasiconcave function of two variables, $z = f(x_1, x_2)$.

13.36

An (upper) level set for the function in (13.35), $P_a = \{(x_1, x_2) \in S : f(x_1, x_2) \geq a\}$.

13.37

$f(\mathbf{x})$ is quasiconcave on an open, convex set S in \mathbb{R}^n if and only if

$$f(\mathbf{x}) \geq f(\mathbf{x}^0) \Rightarrow f(\lambda \mathbf{x} + (1 - \lambda)\mathbf{x}^0) \geq f(\mathbf{x}^0)$$

for all \mathbf{x}, \mathbf{x}^0 in S and all λ in $[0, 1]$.

Characterization of quasiconcavity.

13.38

$f(\mathbf{x})$ is *strictly quasiconcave* on an open, convex set S in \mathbb{R}^n if

$$f(\mathbf{x}) \geq f(\mathbf{x}^0) \Rightarrow f(\lambda \mathbf{x} + (1 - \lambda)\mathbf{x}^0) > f(\mathbf{x}^0)$$

for all $\mathbf{x} \neq \mathbf{x}^0$ in S and all λ in $(0, 1)$.

The (most common) definition of strict quasiconcavity.

13.39

$f(\mathbf{x})$ is (strictly) *quasiconvex* on $S \subset \mathbb{R}^n$ if $-f(\mathbf{x})$ is (strictly) quasiconcave.

Definition of a (strictly) quasiconvex function.

13.40

If f_1, \dots, f_m are concave functions defined on a convex set S in \mathbb{R}^n and g is defined for each \mathbf{x} in S by

$$g(\mathbf{x}) = F(f_1(\mathbf{x}), \dots, f_m(\mathbf{x}))$$

with $F(u_1, \dots, u_m)$ quasiconcave and increasing in each variable, then g is quasiconcave.

A useful result.

- (1) $f(\mathbf{x})$ concave $\Rightarrow f(\mathbf{x})$ quasiconcave.
- (2) $f(\mathbf{x})$ convex $\Rightarrow f(\mathbf{x})$ quasiconvex.
- (3) Any increasing or decreasing function of one variable is quasiconcave and quasiconvex.
- (4) A sum of quasiconcave (quasiconvex) functions is not necessarily quasiconcave (quasiconvex).
- (5) If $f(\mathbf{x})$ is quasiconcave (quasiconvex) and F is increasing, then $F(f(\mathbf{x}))$ is quasiconcave (quasiconvex).
- (6) If $f(\mathbf{x})$ is quasiconcave (quasiconvex) and F is decreasing, then $F(f(\mathbf{x}))$ is quasiconvex (quasiconcave).
- (7) Let $f(\mathbf{x})$ be a function defined on a convex cone K in \mathbb{R}^n . Suppose that f is quasiconcave and homogeneous of degree q , where $0 < q \leq 1$, that $f(\mathbf{0}) = 0$, and that $f(\mathbf{x}) > 0$ for all $\mathbf{x} \neq \mathbf{0}$ in K . Then f is concave.

13.41

Basic facts about quasiconcave and quasiconvex functions. (Example of (4): $f(x) = x^3$ and $g(x) = -x$ are both quasiconcave, but $f(x) + g(x) = x^3 - x$ is not.) For a proof of (7), see Sydsæter et al. (2005).

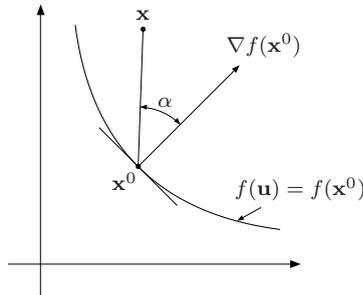

A C^1 function $f(\mathbf{x})$ is quasiconcave on an open, convex set S in \mathbb{R}^n if and only if

$$f(\mathbf{x}) \geq f(\mathbf{x}^0) \Rightarrow \nabla f(\mathbf{x}^0) \cdot (\mathbf{x} - \mathbf{x}^0) \geq 0$$

for all \mathbf{x} and \mathbf{x}^0 in S .

13.42

Quasiconcavity for C^1 functions.

13.43

A geometric interpretation of (13.42). Here $\nabla f(\mathbf{x}^0) \cdot (\mathbf{x} - \mathbf{x}^0) \geq 0$ means that the angle α is acute, i.e. less than 90° .

$$13.44 \quad B_r(\mathbf{x}) = \begin{vmatrix} 0 & f'_1(\mathbf{x}) & \dots & f'_r(\mathbf{x}) \\ f'_1(\mathbf{x}) & f''_{11}(\mathbf{x}) & \dots & f''_{1r}(\mathbf{x}) \\ \vdots & \vdots & \ddots & \vdots \\ f'_r(\mathbf{x}) & f''_{r1}(\mathbf{x}) & \dots & f''_{rr}(\mathbf{x}) \end{vmatrix}$$

A bordered Hessian associated with f at \mathbf{x} .

If $f(\mathbf{x})$ is quasiconcave on an open, convex set S in \mathbb{R}^n , then

$$(-1)^r B_r(\mathbf{x}) \geq 0 \text{ for } r = 1, \dots, n$$

for all $\mathbf{x} \in S$.

13.45

Necessary conditions for quasiconcavity of C^2 functions.

- | | | |

Chapter 14

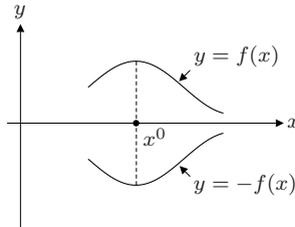

Classical optimization

$f(\mathbf{x}) = f(x_1, \dots, x_n)$ has a *maximum (minimum)* at $\mathbf{x}^* = (x_1^*, \dots, x_n^*) \in S$ if

14.1 $f(\mathbf{x}^*) - f(\mathbf{x}) \geq 0$ (≤ 0) for all \mathbf{x} in S

\mathbf{x}^* is called a *maximum (minimum) point* and $f(\mathbf{x}^*)$ is called a *maximum (minimum) value*.

14.2 \mathbf{x}^* maximizes $f(\mathbf{x})$ over S if and only if \mathbf{x}^* minimizes $-f(\mathbf{x})$ over S .

14.3

Definition of (global) maximum (minimum) of a function of n variables. As collective names, we use *optimal* points and values, or *extreme* points and values.

Used to convert minimization problems to maximization problems.

Illustration of (14.2). x^* maximizes $f(x)$ if and only if x^* minimizes $-f(x)$

Suppose $f(\mathbf{x})$ is defined on $S \subset \mathbb{R}^n$ and that $F(u)$ is strictly increasing on the range of f .

14.4 Then \mathbf{x}^* maximizes (minimizes) $f(\mathbf{x})$ on S if and only if \mathbf{x}^* maximizes (minimizes) $F(f(\mathbf{x}))$ on S .

An important fact.

If $f : S \rightarrow \mathbb{R}$ is continuous on a closed, bounded set S in \mathbb{R}^n , then there exist maximum and minimum points for f in S .

14.5

The *extreme value theorem* (or *Weierstrass's theorem*).

$\mathbf{x}^* = (x_1^*, \dots, x_n^*)$ is a *stationary point* of $f(\mathbf{x})$ if

14.6

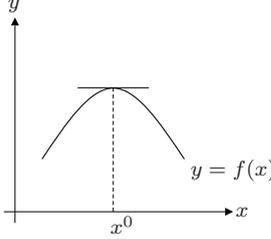

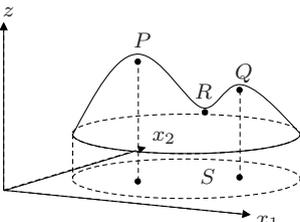

$$f'_1(\mathbf{x}^*) = 0, f'_2(\mathbf{x}^*) = 0, \dots, f'_n(\mathbf{x}^*) = 0$$

Definition of stationary points for a differentiable function of n variables.

Let $f(\mathbf{x})$ be concave (convex) and defined on a convex set S in \mathbb{R}^n , and let \mathbf{x}^* be an interior point of S . Then \mathbf{x}^* maximizes (minimizes) $f(\mathbf{x})$ on S , if and only if \mathbf{x}^* is a stationary point.

14.7

Maximum (minimum) of a concave (convex) function.

- 14.8  One-variable illustration of (14.7). f is concave, $f'(x^*) = 0$, and x^* is a maximum point.
- 14.9 If $f(\mathbf{x})$ has a maximum or minimum in $S \subset \mathbb{R}^n$, then the maximum/minimum points are found among the following points:
- interior points of S that are stationary
 - extreme points of f at the boundary of S
 - points in S where f is not differentiable
- Where to find (global) maximum or minimum points.
- 14.10 $f(\mathbf{x})$ has a *local* maximum (minimum) at \mathbf{x}^* if
- (*) $f(\mathbf{x}^*) - f(\mathbf{x}) \geq 0$ (≤ 0)
- for all \mathbf{x} in S sufficiently close to \mathbf{x}^* . More precisely, there exists an n -ball $B(\mathbf{x}^*; r)$ such that (*) holds for all \mathbf{x} in $S \cap B(\mathbf{x}^*; r)$.
- Definition of local (or *relative*) maximum (minimum) points of a function of n variables. A collective name is *local extreme points*.
- 14.11 If $f(\mathbf{x}) = f(x_1, \dots, x_n)$ has a local maximum (minimum) at an interior point \mathbf{x}^* of S , then \mathbf{x}^* is a stationary point of f .
- The *first-order conditions* for differentiable functions.
- 14.12 A stationary point \mathbf{x}^* of $f(\mathbf{x}) = f(x_1, \dots, x_n)$ is called a *saddle point* if it is neither a local maximum point nor a local minimum point, i.e. if every n -ball $B(\mathbf{x}^*; r)$ contains points \mathbf{x} such that $f(\mathbf{x}) < f(\mathbf{x}^*)$ and other points \mathbf{z} such that $f(\mathbf{z}) > f(\mathbf{x}^*)$.
- Definition of a saddle point.
- 14.13  The points P , Q , and R are all stationary points. P is a maximum point, Q is a local maximum point, whereas R is a saddle point.

Special results for one-variable functions

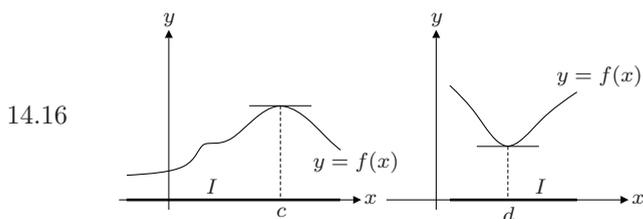

If $f(x)$ is differentiable in an interval I , then

- 14.14
- $f'(x) > 0 \implies f(x)$ is strictly increasing
 - $f'(x) \geq 0 \iff f(x)$ is increasing
 - $f'(x) = 0 \iff f(x)$ is constant
 - $f'(x) \leq 0 \iff f(x)$ is decreasing
 - $f'(x) < 0 \implies f(x)$ is strictly decreasing

Important facts. The implication arrows cannot be reversed. ($f(x) = x^3$ is strictly increasing, but $f'(0) = 0$. $g(x) = -x^3$ is strictly decreasing, but $g'(0) = 0$.)

- 14.15
- If $f'(x) \geq 0$ for $x \leq c$ and $f'(x) \leq 0$ for $x \geq c$, then $x = c$ is a maximum point for f .
 - If $f'(x) \leq 0$ for $x \leq c$, and $f'(x) \geq 0$ for $x \geq c$, then $x = c$ is a minimum point for f .

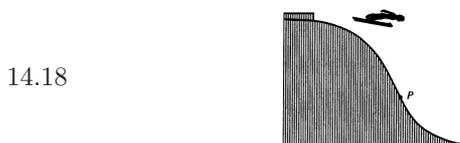

A first-derivative test for (global) max/min. (Often ignored in elementary mathematics for economics texts.)

One-variable illustrations of (14.15). c is a maximum point. d is a minimum point.

- 14.17 c is an *inflection point* for $f(x)$ if $f''(x)$ changes sign at c .

Definition of an inflection point for a function of one variable.

An unorthodox illustration of an inflection point. Point P , where the slope is steepest, is an inflection point.

- 14.19 Let f be a function with a continuous second derivative in an interval I , and suppose that c is an interior point of I . Then:

- c is an inflection point for $f \implies f''(c) = 0$
- $f''(c) = 0$ and f'' changes sign at $c \implies c$ is an inflection point for f

Test for inflection points.

Second-order conditions

If $f(\mathbf{x}) = f(x_1, \dots, x_n)$ has a local maximum (minimum) at \mathbf{x}^* , then

$$14.20 \quad \sum_{i=1}^n \sum_{j=1}^n f''_{ij}(\mathbf{x}^*) h_i h_j \leq 0 \quad (\geq 0)$$

for all choices of h_1, \dots, h_n .

A necessary (second-order) condition for local maximum (minimum).

If $\mathbf{x}^* = (x_1^*, \dots, x_n^*)$ is a stationary point of $f(x_1, \dots, x_n)$, and if $D_k(\mathbf{x}^*)$ is the following determinant,

$$D_k(\mathbf{x}^*) = \begin{vmatrix} f''_{11}(\mathbf{x}^*) & f''_{12}(\mathbf{x}^*) & \dots & f''_{1k}(\mathbf{x}^*) \\ f''_{21}(\mathbf{x}^*) & f''_{22}(\mathbf{x}^*) & \dots & f''_{2k}(\mathbf{x}^*) \\ \vdots & \vdots & \ddots & \vdots \\ f''_{k1}(\mathbf{x}^*) & f''_{k2}(\mathbf{x}^*) & \dots & f''_{kk}(\mathbf{x}^*) \end{vmatrix}$$

14.21 then:

- If $(-1)^k D_k(\mathbf{x}^*) > 0$ for $k = 1, \dots, n$, then \mathbf{x}^* is a local maximum point.
- If $D_k(\mathbf{x}^*) > 0$ for $k = 1, \dots, n$, then \mathbf{x}^* is a local minimum point.
- If $D_n(\mathbf{x}^*) \neq 0$ and neither of the two conditions above is satisfied, then \mathbf{x}^* is a saddle point.

Classification of stationary points of a C^2 function of n variables. *Second-order conditions* for local maximum/minimum.

$$f'(x^*) = 0 \text{ and } f''(x^*) < 0 \implies$$

14.22 x^* is a local maximum point for f .

$$f'(x^*) = 0 \text{ and } f''(x^*) > 0 \implies$$

x^* is a local minimum point for f .

One-variable second-order conditions for local maximum/minimum.

If (x_0, y_0) is a stationary point of $f(x, y)$ and $D = f''_{11}(x_0, y_0)f''_{22}(x_0, y_0) - (f''_{12}(x_0, y_0))^2$, then

14.23 • $f''_{11}(x_0, y_0) > 0$ and $D > 0 \implies$
 (x_0, y_0) is a local minimum point for f .

• $f''_{11}(x_0, y_0) < 0$ and $D > 0 \implies$
 (x_0, y_0) is a local maximum point for f .

• $D < 0 \implies (x_0, y_0)$ is a saddle point for f .

Two-variable second-order conditions for local maximum/minimum. (Classification of stationary points of a C^2 function of two variables.)

Optimization with equality constraints

$$14.24 \quad \max (\min) \quad f(x, y) \quad \text{subject to} \quad g(x, y) = b$$

The *Lagrange problem*.
Two variables, one constraint.

Lagrange's method. Recipe for solving (14.24):

(1) Introduce the *Lagrangian function*

$$\mathcal{L}(x, y) = f(x, y) - \lambda(g(x, y) - b)$$

where λ is a constant.

(2) Differentiate \mathcal{L} with respect to x and y , and equate the partials to 0.

(3) The two equations in (2), together with the constraint, yield the following three equations:

14.25

$$f'_1(x, y) = \lambda g'_1(x, y)$$

$$f'_2(x, y) = \lambda g'_2(x, y)$$

$$g(x, y) = b$$

(4) Solve these three equations for the three unknowns x , y , and λ . In this way you find all possible pairs (x, y) that can solve the problem.

Necessary conditions for the solution of (14.24). Assume that $g'_1(x, y)$ and $g'_2(x, y)$ do not both vanish. For a more precise version, see (14.27). λ is called a *Lagrange multiplier*.

Suppose (x_0, y_0) satisfies the conditions in (14.25). Then:

14.26

(1) If $\mathcal{L}(x, y)$ is concave, then (x_0, y_0) solves the maximization problem in (14.24).

(2) If $\mathcal{L}(x, y)$ is convex, then (x_0, y_0) solves the minimization problem in (14.24).

Sufficient conditions for the solution of problem (14.24).

Suppose that $f(x, y)$ and $g(x, y)$ are C^1 in a domain S of the xy -plane, and that (x_0, y_0) is both an interior point of S and a local extreme point for $f(x, y)$ subject to the constraint $g(x, y) = b$. Suppose further that $g'_1(x_0, y_0)$ and $g'_2(x_0, y_0)$ are not both 0. Then there exists a unique number λ such that the Lagrangian function

14.27

$$\mathcal{L}(x, y) = f(x, y) - \lambda(g(x, y) - b)$$

has a stationary point at (x_0, y_0) .

A precise version of the Lagrange multiplier method. (*Lagrange's theorem*.)

Consider the problem

$$\text{local max}(\min) f(x, y) \text{ s.t. } g(x, y) = b$$

where (x_0, y_0) satisfies the first-order conditions in (14.25). Define the bordered Hessian determinant $D(x, y)$ as

$$14.28 \quad D(x, y) = \begin{vmatrix} 0 & g'_1 & g'_2 \\ g'_1 & f''_{11} - \lambda g''_{11} & f''_{12} - \lambda g''_{12} \\ g'_2 & f''_{21} - \lambda g''_{21} & f''_{22} - \lambda g''_{22} \end{vmatrix}$$

- (1) If $D(x_0, y_0) > 0$, then (x_0, y_0) solves the local maximization problem.
- (2) If $D(x_0, y_0) < 0$, then (x_0, y_0) solves the local minimization problem.

Local sufficient conditions for the Lagrange problem.

$$14.29 \quad \text{max}(\min) f(x_1, \dots, x_n) \text{ s.t. } \begin{cases} g_1(x_1, \dots, x_n) = b_1 \\ \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots \\ g_m(x_1, \dots, x_n) = b_m \end{cases}$$

The general Lagrange problem. Assume $m < n$.

Lagrange's method. Recipe for solving (14.29):

- (1) Introduce the Lagrangian function

$$\mathcal{L}(\mathbf{x}) = f(\mathbf{x}) - \sum_{j=1}^m \lambda_j (g_j(\mathbf{x}) - b_j)$$

where $\lambda_1, \dots, \lambda_m$ are constants.

- 14.30 (2) Equate the first-order partials of \mathcal{L} to 0:

$$\frac{\partial \mathcal{L}(\mathbf{x})}{\partial x_k} = \frac{\partial f(\mathbf{x})}{\partial x_k} - \sum_{j=1}^m \lambda_j \frac{\partial g_j(\mathbf{x})}{\partial x_k} = 0$$

- (3) Solve these n equations together with the m constraints for x_1, \dots, x_n and $\lambda_1, \dots, \lambda_m$.

Necessary conditions for the solution of (14.29), with f and g_1, \dots, g_m as C^1 functions in an open set S in \mathbb{R}^n , and with $\mathbf{x} = (x_1, \dots, x_n)$. Assume the rank of the Jacobian $(\partial g_j / \partial x_i)_{m \times n}$ to be equal to m . (See (6.8).) $\lambda_1, \dots, \lambda_m$ are called Lagrange multipliers.

If \mathbf{x}^* is a solution to problem (14.29) and the gradients $\nabla g_1(\mathbf{x}^*), \dots, \nabla g_m(\mathbf{x}^*)$ are linearly independent, then there exist unique numbers $\lambda_1, \dots, \lambda_m$ such that

$$14.31 \quad \nabla f(\mathbf{x}^*) = \lambda_1 \nabla g_1(\mathbf{x}^*) + \dots + \lambda_m \nabla g_m(\mathbf{x}^*)$$

An alternative formulation of (14.30).

Suppose $f(\mathbf{x})$ and $g_1(\mathbf{x}), \dots, g_m(\mathbf{x})$ in (14.29) are defined on an open, convex set S in \mathbb{R}^n . Let $\mathbf{x}^* \in S$ be a stationary point of the Lagrangian and suppose $g_j(\mathbf{x}^*) = b_j, j = 1, \dots, m$. Then:

$$14.32 \quad \mathcal{L}(\mathbf{x}) \text{ concave} \Rightarrow \mathbf{x}^* \text{ solves problem (14.29).}$$

Sufficient conditions for the solution of problem (14.29). (For the minimization problem, replace " $\mathcal{L}(\mathbf{x})$ concave" by " $\mathcal{L}(\mathbf{x})$ convex".)

$$14.33 \quad B_r = \begin{vmatrix} 0 & \cdots & 0 & \frac{\partial g_1}{\partial x_1} & \cdots & \frac{\partial g_1}{\partial x_r} \\ \vdots & \ddots & \vdots & \vdots & & \vdots \\ 0 & \cdots & 0 & \frac{\partial g_m}{\partial x_1} & \cdots & \frac{\partial g_m}{\partial x_r} \\ \frac{\partial g_1}{\partial x_1} & \cdots & \frac{\partial g_m}{\partial x_1} & \mathcal{L}''_{11} & \cdots & \mathcal{L}''_{1r} \\ \vdots & & \vdots & \vdots & \ddots & \vdots \\ \frac{\partial g_1}{\partial x_r} & \cdots & \frac{\partial g_m}{\partial x_r} & \mathcal{L}''_{r1} & \cdots & \mathcal{L}''_{rr} \end{vmatrix}$$

A bordered Hessian determinant associated with problem (14.29), $r = 1, \dots, n$. \mathcal{L} is the Lagrangian defined in (14.30).

Let $f(\mathbf{x})$ and $g_1(\mathbf{x}), \dots, g_m(\mathbf{x})$ be C^2 functions in an open set S in \mathbb{R}^n , and let $\mathbf{x}^* \in S$ satisfy the necessary conditions for problem (14.29) given in (14.30). Let $B_r(\mathbf{x}^*)$ be the determinant in (14.33) evaluated at \mathbf{x}^* . Then:

- 14.34
- If $(-1)^m B_r(\mathbf{x}^*) > 0$ for $r = m + 1, \dots, n$, then \mathbf{x}^* is a local minimum point for problem (14.29).
 - If $(-1)^r B_r(\mathbf{x}^*) > 0$ for $r = m + 1, \dots, n$, then \mathbf{x}^* is a local maximum point for problem (14.29).

Local sufficient conditions for the Lagrange problem.

Value functions and sensitivity

$$14.35 \quad f^*(\mathbf{b}) = \max_{\mathbf{x}} \{f(\mathbf{x}) : g_j(\mathbf{x}) = b_j, j = 1, \dots, m\}$$

$f^*(\mathbf{b})$ is the value function. $\mathbf{b} = (b_1, \dots, b_m)$.

$$14.36 \quad \frac{\partial f^*(\mathbf{b})}{\partial b_i} = \lambda_i(\mathbf{b}), \quad i = 1, \dots, m$$

The $\lambda_i(\mathbf{b})$'s are the unique Lagrange multipliers from (14.31). (For a precise result see Sydsæter et al. (2005), Chap. 3.)

$$14.37 \quad f^*(\mathbf{r}) = \max_{\mathbf{x} \in X} f(\mathbf{x}, \mathbf{r}), \quad X \subset \mathbb{R}^n, \mathbf{r} \in A \subset \mathbb{R}^k.$$

The value function of a maximization problem.

- 14.38
- If $f(\mathbf{x}, \mathbf{r})$ is continuous on $X \times A$ and X is compact and nonempty, then $f^*(\mathbf{r})$ defined in (14.37) is continuous on A . If the problem in (14.37) has a unique solution $\mathbf{x} = \mathbf{x}(\mathbf{r})$ for each \mathbf{r} in A , then $\mathbf{x}(\mathbf{r})$ is a continuous function of \mathbf{r} .

Continuity of the value function and the maximizer.

Suppose that the problem of maximizing $f(\mathbf{x}, \mathbf{r})$ for \mathbf{x} in a compact set $X \subset \mathbb{R}^n$ has a unique solution $\mathbf{x}(\mathbf{r}^0)$ at $\mathbf{r} = \mathbf{r}^0$, and that $\partial f / \partial r_i$, $i = 1, \dots, k$, exist and are continuous in a neighborhood of $(\mathbf{x}(\mathbf{r}^0), \mathbf{r}^0)$. Then for $i = 1, \dots, k$,

$$\frac{\partial f^*(\mathbf{r}^0)}{\partial r_i} = \left[\frac{\partial f(\mathbf{x}, \mathbf{r})}{\partial r_i} \right]_{\substack{\mathbf{x}=\mathbf{x}(\mathbf{r}^0) \\ \mathbf{r}=\mathbf{r}^0}}$$

An *envelope theorem*.

14.40 $\max_{\mathbf{x}} f(\mathbf{x}, \mathbf{r})$ s.t. $g_j(\mathbf{x}, \mathbf{r}) = 0$, $j = 1, \dots, m$

A Lagrange problem with parameters, $\mathbf{r} = (r_1, \dots, r_k)$.

14.41 $f^*(\mathbf{r}) = \max\{f(\mathbf{x}, \mathbf{r}) : g_j(\mathbf{x}, \mathbf{r}) = 0, j = 1, \dots, m\}$

The *value function* of problem (14.40).

14.42 $\frac{\partial f^*(\mathbf{r}^0)}{\partial r_i} = \left[\frac{\partial \mathcal{L}(\mathbf{x}, \mathbf{r})}{\partial r_i} \right]_{\substack{\mathbf{x}=\mathbf{x}(\mathbf{r}^0) \\ \mathbf{r}=\mathbf{r}^0}}, \quad i = 1, \dots, k$

An *envelope theorem* for (14.40). $\mathcal{L} = f - \sum \lambda_j g_j$ is the Lagrangian. For precise assumptions for the equality to hold, see Sydsæter et al. (2005), Chapter 3.

References

See Simon and Blume (1994), Sydsæter et al. (2005), Intriligator (1971), Luenberger (1984), and Dixit (1990).

Chapter 15

Linear and nonlinear programming

Linear programming

$$\begin{aligned}
 & \max z = c_1x_1 + \cdots + c_nx_n \text{ subject to} \\
 & a_{11}x_1 + \cdots + a_{1n}x_n \leq b_1 \\
 15.1 \quad & a_{21}x_1 + \cdots + a_{2n}x_n \leq b_2 \\
 & \dots\dots\dots \\
 & a_{m1}x_1 + \cdots + a_{mn}x_n \leq b_m \\
 & x_1 \geq 0, \dots, x_n \geq 0
 \end{aligned}$$

A linear programming problem. (The primal problem.) $\sum_{j=1}^n c_jx_j$ is called the *objective function*. (x_1, \dots, x_n) is *admissible* if it satisfies all the $m + n$ constraints.

$$\begin{aligned}
 & \min Z = b_1\lambda_1 + \cdots + b_m\lambda_m \text{ subject to} \\
 & a_{11}\lambda_1 + \cdots + a_{m1}\lambda_m \geq c_1 \\
 15.2 \quad & a_{12}\lambda_1 + \cdots + a_{m2}\lambda_m \geq c_2 \\
 & \dots\dots\dots \\
 & a_{1n}\lambda_1 + \cdots + a_{mn}\lambda_m \geq c_n \\
 & \lambda_1 \geq 0, \dots, \lambda_m \geq 0
 \end{aligned}$$

The *dual* of (15.1). $\sum_{i=1}^m b_i\lambda_i$ is called the *objective function*. $(\lambda_1, \dots, \lambda_m)$ is *admissible* if it satisfies all the $n + m$ constraints.

$$\begin{aligned}
 15.3 \quad & \max \mathbf{c}'\mathbf{x} \text{ subject to } \mathbf{Ax} \leq \mathbf{b}, \mathbf{x} \geq \mathbf{0} \\
 & \min \mathbf{b}'\boldsymbol{\lambda} \text{ subject to } \mathbf{A}'\boldsymbol{\lambda} \geq \mathbf{c}, \boldsymbol{\lambda} \geq \mathbf{0}
 \end{aligned}$$

Matrix formulations of (15.1) and (15.2).
 $\mathbf{A} = (a_{ij})_{m \times n}$,
 $\mathbf{x} = (x_j)_{n \times 1}$,
 $\boldsymbol{\lambda} = (\lambda_i)_{m \times 1}$,
 $\mathbf{c} = (c_j)_{n \times 1}$,
 $\mathbf{b} = (b_i)_{m \times 1}$.

$$\begin{aligned}
 15.4 \quad & \text{If } (x_1, \dots, x_n) \text{ and } (\lambda_1, \dots, \lambda_m) \text{ are admissible} \\
 & \text{in (15.1) and (15.2), respectively, then} \\
 & b_1\lambda_1 + \cdots + b_m\lambda_m \geq c_1x_1 + \cdots + c_nx_n
 \end{aligned}$$

The value of the objective function in the dual is always greater than or equal to the value of the objective function in the primal.

- Suppose (x_1^*, \dots, x_n^*) and $(\lambda_1^*, \dots, \lambda_m^*)$ are admissible in (15.1) and (15.2) respectively, and that
- 15.5
$$c_1 x_1^* + \dots + c_n x_n^* = b_1 \lambda_1^* + \dots + b_m \lambda_m^*$$
 Then (x_1^*, \dots, x_n^*) and $(\lambda_1^*, \dots, \lambda_m^*)$ are optimal in the respective problems.
- 15.6 If either of the problems (15.1) and (15.2) has a finite optimal solution, so has the other, and the corresponding values of the objective functions are equal. If either problem has an “unbounded optimum”, then the other problem has no admissible solutions.
- 15.7 Consider problem (15.1). If we change b_i to $b_i + \Delta b_i$ for $i = 1, \dots, m$, and if the associated dual problem still has the same optimal solution, $(\lambda_1^*, \dots, \lambda_m^*)$, then the change in the optimal value of the objective function of the primal problem is
- $$\Delta z^* = \lambda_1^* \Delta b_1 + \dots + \lambda_m^* \Delta b_m$$
- 15.8 The i th optimal dual variable λ_i^* is equal to the change in objective function of the primal problem (15.1) when b_i is increased by one unit.
- 15.9 Suppose that the primal problem (15.1) has an optimal solution (x_1^*, \dots, x_n^*) and that the dual (15.2) has an optimal solution $(\lambda_1^*, \dots, \lambda_m^*)$. Then for $i = 1, \dots, n$, $j = 1, \dots, m$:
- (1) $x_j^* > 0 \Rightarrow a_{1j} \lambda_1^* + \dots + a_{mj} \lambda_m^* = c_j$
 - (2) $\lambda_i^* > 0 \Rightarrow a_{i1} x_1^* + \dots + a_{in} x_n^* = b_i$
- 15.10 Let \mathbf{A} be an $m \times n$ -matrix and \mathbf{b} an n -vector. Then there exists a vector \mathbf{y} with $\mathbf{A}\mathbf{y} \geq \mathbf{0}$ and $\mathbf{b}'\mathbf{y} < 0$ if and only if there is no $\mathbf{x} \geq \mathbf{0}$ such that $\mathbf{A}'\mathbf{x} = \mathbf{b}$.

An interesting result.

The *duality theorem* of linear programming.

An important sensitivity result. (The dual problem usually *will* have the same solution if $|\Delta b_1|, \dots, |\Delta b_m|$ are sufficiently small.)

Interpretation of λ_i^* as a “*shadow price*”. (A special case of (15.7), with the same qualifications.)

Complementary slackness. ((1): If the optimal variable j in the primal is positive, then restriction j in the dual is an equality at the optimum. (2) has a similar interpretation.)

Farkas’s lemma.

Nonlinear programming

- 15.11 $\max f(x, y)$ subject to $g(x, y) \leq b$

A *nonlinear programming problem*.

Recipe for solving problem (15.11):

- (1) Define the Lagrangian function \mathcal{L} by

$$\mathcal{L}(x, y, \lambda) = f(x, y) - \lambda(g(x, y) - b)$$

where λ is a *Lagrange multiplier* associated with the constraint $g(x, y) \leq b$.

- (2) Equate the partial derivatives of $\mathcal{L}(x, y, \lambda)$ w.r.t. x and y to zero:

$$\mathcal{L}'_1(x, y, \lambda) = f'_1(x, y) - \lambda g'_1(x, y) = 0$$

$$\mathcal{L}'_2(x, y, \lambda) = f'_2(x, y) - \lambda g'_2(x, y) = 0$$

- (3) Introduce the *complementary slackness condition*

$$\lambda \geq 0 \quad (\lambda = 0 \text{ if } g(x, y) < b)$$

- (4) Require (x, y) to satisfy $g(x, y) \leq b$.

Kuhn-Tucker necessary conditions for solving problem (15.11), made more precise in (15.20). If we find all the pairs (x, y) (together with suitable values of λ) that satisfy all these conditions, then we have all the candidates for the solution of problem. If the Lagrangian is concave in (x, y) , then the conditions are sufficient for optimality.

$$15.13 \quad \max_{\mathbf{x}} f(\mathbf{x}) \quad \text{subject to} \quad \begin{cases} g_1(\mathbf{x}) \leq b_1 \\ \dots\dots\dots \\ g_m(\mathbf{x}) \leq b_m \end{cases}$$

A *nonlinear programming problem*. A vector $\mathbf{x} = (x_1, \dots, x_n)$ is *admissible* if it satisfies all the constraints.

$$15.14 \quad \mathcal{L}(\mathbf{x}, \boldsymbol{\lambda}) = f(\mathbf{x}) - \sum_{j=1}^m \lambda_j (g_j(\mathbf{x}) - b_j)$$

The *Lagrangian function* associated with (15.13). $\boldsymbol{\lambda} = (\lambda_1, \dots, \lambda_m)$ are *Lagrange multipliers*.

Consider problem (15.13) and assume that f and g_1, \dots, g_m are C^1 . Suppose that there exist a vector $\boldsymbol{\lambda} = (\lambda_1, \dots, \lambda_m)$ and an admissible vector $\mathbf{x}^0 = (x_1^0, \dots, x_n^0)$ such that

$$15.15 \quad \text{(a) } \frac{\partial \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})}{\partial x_i} = 0, \quad i = 1, \dots, n$$

- (b) For all $j = 1, \dots, m$,

$$\lambda_j \geq 0 \quad (\lambda_j = 0 \text{ if } g_j(\mathbf{x}^0) < b_j)$$

- (c) The Lagrangian function $\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda})$ is a concave function of \mathbf{x} .

Then \mathbf{x}^0 solves problem (15.13).

Sufficient conditions.

$$15.16 \quad \text{(b')} \quad \lambda_j \geq 0 \text{ and } \lambda_j (g_j(\mathbf{x}^0) - b_j) = 0, \quad j = 1, \dots, m$$

Alternative formulation of (b) in (15.15).

(15.15) is also valid if we replace (c) by the condition

$$15.17 \quad \text{(c')} \quad f(\mathbf{x}) \text{ is concave and } \lambda_j g_j(\mathbf{x}) \text{ is quasi-convex for } j = 1, \dots, m.$$

Alternative sufficient conditions.

- 15.18 Constraint j in (15.13) is called *active at \mathbf{x}^0* if $g_j(\mathbf{x}^0) = b_j$. | Definition of an *active* (or *binding*) constraint.
- 15.19 The following condition is often imposed in problem (15.13): The gradients at \mathbf{x}^0 of those g_j -functions whose constraints are active at \mathbf{x}^0 , are linearly independent. | A *constraint qualification* for problem (15.13).
- 15.20 Suppose that $\mathbf{x}^0 = (x_1^0, \dots, x_n^0)$ solves (15.13) and that f and g_1, \dots, g_m are C^1 . Suppose further that the constraint qualification (15.19) is satisfied at \mathbf{x}^0 . Then there exist unique numbers $\lambda_1, \dots, \lambda_m$ such that
 (a) $\frac{\partial \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})}{\partial x_i} = 0, \quad i = 1, \dots, n$
 (b) $\lambda_j \geq 0$ ($\lambda_j = 0$ if $g_j(\mathbf{x}^0) < b_j$), $j = 1, \dots, m$ | Kuhn–Tucker necessary conditions for problem (15.13). (Note that all admissible points where the constraint qualification fails to hold are candidates for optimality.)
- 15.21 $(\mathbf{x}^0, \boldsymbol{\lambda}^0)$ is a *saddle point* of the Lagrangian $\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda})$ if $\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda}^0) \leq \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda}^0) \leq \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})$ for all $\boldsymbol{\lambda} \geq \mathbf{0}$ and all \mathbf{x} . | Definition of a saddle point for problem (15.13).
- 15.22 If $\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda})$ has a saddle point $(\mathbf{x}^0, \boldsymbol{\lambda}^0)$, then $(\mathbf{x}^0, \boldsymbol{\lambda}^0)$ solves problem (15.13). | Sufficient conditions for problem (15.13). (No differentiability or concavity conditions are required.)
- 15.23 The following condition is often imposed in problem (15.13): For some vector $\mathbf{x}' = (x'_1, \dots, x'_n)$, $g_j(\mathbf{x}') < b_j$ for $j = 1, \dots, m$. | The *Slater condition* (constraint qualification).
- 15.24 Consider problem (15.13), assuming f is concave and g_1, \dots, g_m are convex. Assume that the Slater condition (15.23) is satisfied. Then a necessary and sufficient condition for \mathbf{x}^0 to solve the problem is that there exist nonnegative numbers $\lambda_1^0, \dots, \lambda_m^0$ such that $(\mathbf{x}^0, \boldsymbol{\lambda}^0)$ is a saddle point of the Lagrangian $\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda})$. | A saddle point result for concave programming.

- Consider problem (15.13) and assume that f and g_1, \dots, g_m are C^1 . Suppose that there exist numbers $\lambda_1, \dots, \lambda_m$ and a vector \mathbf{x}^0 such that
- 15.25
- \mathbf{x}^0 satisfies (a) and (b) in (15.15).
 - $\nabla f(\mathbf{x}^0) \neq \mathbf{0}$
 - $f(\mathbf{x})$ is quasi-concave and $\lambda_j g_j(\mathbf{x})$ is quasi-convex for $j = 1, \dots, m$.
- Then \mathbf{x}^0 solves problem (15.13).
- Sufficient conditions for *quasi-concave programming*.
- 15.26 $f^*(\mathbf{b}) = \max\{f(\mathbf{x}) : g_j(\mathbf{x}) \leq b_j, j = 1, \dots, m\}$
- The *value function* of (15.13), assuming that the maximum value exists, with $\mathbf{b} = (b_1, \dots, b_m)$.
- 15.27
- (1) $f^*(\mathbf{b})$ is increasing in each variable.
 - (2) $\partial f^*(\mathbf{b})/\partial b_j = \lambda_j(\mathbf{b}), j = 1, \dots, m$
 - (3) If $f(\mathbf{x})$ is concave and $g_1(\mathbf{x}), \dots, g_m(\mathbf{x})$ are convex, then $f^*(\mathbf{b})$ is concave.
- Properties of the value function.
- 15.28 $\max_{\mathbf{x}} f(\mathbf{x}, \mathbf{r})$ s.t. $g_j(\mathbf{x}, \mathbf{r}) \leq 0, j = 1, \dots, m$
- A nonlinear programming problem with parameters, $\mathbf{r} \in \mathbb{R}^k$.
- 15.29 $f^*(\mathbf{r}) = \max\{f(\mathbf{x}, \mathbf{r}) : g_j(\mathbf{x}, \mathbf{r}) \leq 0, j = 1, \dots, m\}$
- The *value function* of problem (15.28).
- 15.30 $\frac{\partial f^*(\mathbf{r}^*)}{\partial r_i} = \left[\frac{\partial \mathcal{L}(\mathbf{x}, \mathbf{r}, \boldsymbol{\lambda})}{\partial r_i} \right]_{\substack{\mathbf{x}=\mathbf{x}(\mathbf{r}^*) \\ \mathbf{r}=\mathbf{r}^*}}, i = 1, \dots, k$
- An *envelope theorem* for problem (15.28). $\mathcal{L} = f - \sum \lambda_j g_j$ is the Lagrangian. See Sydsæter et al. (2005), Section 3.8 and Clarke (1983) for a precise result.

Nonlinear programming with nonnegativity conditions

- 15.31 $\max_{\mathbf{x}} f(\mathbf{x})$ subject to $\begin{cases} g_1(\mathbf{x}) \leq b_1 \\ \dots\dots\dots \\ g_m(\mathbf{x}) \leq b_m \end{cases}, \mathbf{x} \geq \mathbf{0}$
- If the nonnegativity constraints are written as $g_{m+i}(\mathbf{x}) = -x_i \leq 0$ for $i = 1, \dots, n$, (15.31) reduces to (15.13).

Suppose in problem (15.31) that f and g_1, \dots, g_m are C^1 functions, and that there exist numbers $\lambda_1, \dots, \lambda_m$, and an admissible vector \mathbf{x}^0 such that:

- 15.32 (a) For all $i = 1, \dots, n$, one has $x_i^0 \geq 0$ and
- $$\frac{\partial \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})}{\partial x_i} \leq 0, \quad x_i^0 \frac{\partial \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})}{\partial x_i} = 0$$
- (b) For all $j = 1, \dots, m$,
- $$\lambda_j \geq 0 \quad (\lambda_j = 0 \text{ if } g_j(\mathbf{x}^0) < b_j)$$
- (c) The Lagrangian function $\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda})$ is a concave function of \mathbf{x} .

Then \mathbf{x}^0 solves problem (15.31).

Sufficient conditions for problem (15.31). $\boldsymbol{\lambda} = (\lambda_i)_{m \times 1}$. $\mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})$ is defined in (15.14).

- 15.33 In (15.32), (c) can be replaced by
- (c') $f(\mathbf{x})$ is concave and $\lambda_j g_j(\mathbf{x})$ is quasi-convex for $j = 1, \dots, m$.

Alternative sufficient conditions.

- 15.34 Suppose that $\mathbf{x}^0 = (x_1^0, \dots, x_n^0)$ solves (15.31) and that f and g_1, \dots, g_m are C^1 . Suppose also that the gradients at \mathbf{x}^0 of those g_j (including the functions g_{m+1}, \dots, g_{m+n} defined in the comment to (15.31)) that correspond to constraints that are active at \mathbf{x}^0 , are linearly independent. Then there exist unique numbers $\lambda_1, \dots, \lambda_m$ such that:

- (a) For all $i = 1, \dots, n$, $x_i^0 \geq 0$, and
- $$\frac{\partial \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})}{\partial x_i} \leq 0, \quad x_i^0 \frac{\partial \mathcal{L}(\mathbf{x}^0, \boldsymbol{\lambda})}{\partial x_i} = 0$$
- (b) $\lambda_j \geq 0$ ($\lambda_j = 0$ if $g_j(\mathbf{x}^0) < b_j$), $j = 1, \dots, m$

The Kuhn–Tucker necessary conditions for problem (15.31). (Note that all admissible points where the constraint qualification fails to hold, are candidates for optimality.)

Chapter 16

Calculus of variations and optimal control theory

Calculus of variations

The simplest problem in the calculus of variations (t_0 , t_1 , x^0 , and x^1 are fixed numbers):

$$16.1 \quad \max \int_{t_0}^{t_1} F(t, x, \dot{x}) dt, \quad x(t_0) = x^0, \quad x(t_1) = x^1$$

F is a C^2 function. The unknown $x = x(t)$ is *admissible* if it is C^1 and satisfies the two boundary conditions. To handle the minimization problem, replace F by $-F$.

$$16.2 \quad \frac{\partial F}{\partial x} - \frac{d}{dt} \left(\frac{\partial F}{\partial \dot{x}} \right) = 0$$

The *Euler equation*. A necessary condition for the solution of (16.1).

$$16.3 \quad \frac{\partial^2 F}{\partial \dot{x} \partial \dot{x}} \cdot \ddot{x} + \frac{\partial^2 F}{\partial x \partial \dot{x}} \cdot \dot{x} + \frac{\partial^2 F}{\partial t \partial \dot{x}} - \frac{\partial F}{\partial x} = 0$$

An alternative form of the Euler equation.

$$16.4 \quad F''_{\dot{x}\dot{x}}(t, x(t), \dot{x}(t)) \leq 0 \text{ for all } t \text{ in } [t_0, t_1]$$

The *Legendre condition*. A necessary condition for the solution of (16.1).

16.5 If $F(t, x, \dot{x})$ is concave in (x, \dot{x}) , an admissible function $x = x(t)$ that satisfies the Euler equation, solves problem (16.1).

Sufficient conditions for the solution of (16.1).

$$16.6 \quad x(t_1) \text{ free in (16.1)} \Rightarrow \left[\frac{\partial F}{\partial \dot{x}} \right]_{t=t_1} = 0$$

Transversality condition. Adding condition (16.5) gives sufficient conditions.

- 16.7 $x(t_1) \geq x^1$ in (16.1) \Rightarrow

$$\left[\frac{\partial F}{\partial \dot{x}} \right]_{t=t_1} \leq 0 \quad (= 0 \text{ if } x(t_1) > x^1)$$
 | Transversality condition. Adding condition (16.5) gives sufficient conditions.
- 16.8 t_1 free in (16.1) \Rightarrow

$$\left[F - \dot{x} \frac{\partial F}{\partial \dot{x}} \right]_{t=t_1} = 0$$
 | Transversality condition.
- 16.9 $x(t_1) = g(t_1)$ in (16.1) \Rightarrow

$$\left[F + (\dot{g} - \dot{x}) \frac{\partial F}{\partial \dot{x}} \right]_{t=t_1} = 0$$
 | Transversality condition. g is a given C^1 function.
- 16.10 $\max \left[\int_{t_0}^{t_1} F(t, x, \dot{x}) dt + S(x(t_1)) \right], \quad x(t_0) = x^0$
 | A variational problem with a C^1 scrap value function, S .
- 16.11 $\left[\frac{\partial F}{\partial \dot{x}} \right]_{t=t_1} + S'(x(t_1)) = 0$
 | A solution to (16.10) must satisfy (16.2) and this transversality condition.
- 16.12 If $F(t, x, \dot{x})$ is concave in (x, \dot{x}) and $S(x)$ is concave, then an admissible function satisfying the Euler equation and (16.11) solves problem (16.10).
 | Sufficient conditions for the solution to (16.10).
- 16.13 $\max \int_{t_0}^{t_1} F \left(t, x, \frac{dx}{dt}, \frac{d^2x}{dt^2}, \dots, \frac{d^n x}{dt^n} \right) dt$
 | A variational problem with higher order derivatives. (Boundary conditions are unspecified.)
- 16.14 $\frac{\partial F}{\partial x} - \frac{d}{dt} \left(\frac{\partial F}{\partial \dot{x}} \right) + \dots + (-1)^n \frac{d^n}{dt^n} \left(\frac{\partial F}{\partial x^{(n)}} \right) = 0$
 | The (generalized) Euler equation for (16.13).
- 16.15 $\max \iint_R F \left(t, s, x, \frac{\partial x}{\partial t}, \frac{\partial x}{\partial s} \right) dt ds$
 | A variational problem in which the unknown $x(t, s)$ is a function of two variables. (Boundary conditions are unspecified.)
- 16.16 $\frac{\partial F}{\partial x} - \frac{\partial}{\partial t} \left(\frac{\partial F}{\partial x'_t} \right) - \frac{\partial}{\partial s} \left(\frac{\partial F}{\partial x'_s} \right) = 0$
 | The (generalized) Euler equation for (16.15).

Optimal control theory. One state and one control variable

The simplest case. Fixed time interval $[t_0, t_1]$ and free right hand side:

$$16.17 \quad \max \int_{t_0}^{t_1} f(t, x(t), u(t)) dt \quad u(t) \in \mathbb{R},$$

$$\dot{x}(t) = g(t, x(t), u(t)), \quad x(t_0) = x^0, \quad x(t_1) \text{ free}$$

The pair $(x(t), u(t))$ is *admissible* if it satisfies the differential equation, $x(t_0) = x^0$, and $u(t)$ is piecewise continuous. To handle the minimization problem, replace f by $-f$.

$$16.18 \quad H(t, x, u, p) = f(t, x, u) + pg(t, x, u)$$

The Hamiltonian associated with (16.17).

Suppose $(x^*(t), u^*(t))$ solves problem (16.17). Then there exists a continuous function $p(t)$ such that for each t in $[t_0, t_1]$,

$$16.19 \quad (1) \quad H(t, x^*(t), u, p(t)) \leq H(t, x^*(t), u^*(t), p(t))$$

for all u in \mathbb{R} . In particular,

$$H'_u(t, x^*(t), u^*(t), p(t)) = 0$$

(2) The function $p(t)$ satisfies

$$\dot{p}(t) = -H'_x(t, x^*(t), u^*(t), p(t)), \quad p(t_1) = 0$$

The *maximum principle*. The differential equation for $p(t)$ is not necessarily valid at the discontinuity points of $u^*(t)$. The equation $p(t_1) = 0$ is called a *transversality condition*.

16.20 If $(x^*(t), u^*(t))$ satisfies the conditions in (16.19) and $H(t, x, u, p(t))$ is concave in (x, u) , then $(x^*(t), u^*(t))$ solves problem (16.17).

Mangasarian's sufficient conditions for problem (16.17).

$$16.21 \quad \max \int_{t_0}^{t_1} f(t, x(t), u(t)) dt, \quad u(t) \in U \subset \mathbb{R},$$

$$\dot{x}(t) = g(t, x(t), u(t)), \quad x(t_0) = x^0$$

(a) $x(t_1) = x^1$ or (b) $x(t_1) \geq x^1$

A control problem with terminal conditions and fixed time interval. U is the *control region*. $u(t)$ is piecewise continuous.

$$16.22 \quad H(t, x, u, p) = p_0 f(t, x, u) + pg(t, x, u)$$

The Hamiltonian associated with (16.21).

Suppose $(x^*(t), u^*(t))$ solves problem (16.21). Then there exist a continuous function $p(t)$ and a number p_0 such that for all t in $[t_0, t_1]$,

$$16.23 \quad (1) \quad p_0 = 0 \text{ or } 1 \text{ and } (p_0, p(t)) \text{ is never } (0, 0).$$

(2) $H(t, x^*(t), u, p(t)) \leq H(t, x^*(t), u^*(t), p(t))$ for all u in U .

(3) $\dot{p}(t) = -H'_x(t, x^*(t), u^*(t), p(t))$

(4) (a') No conditions on $p(t_1)$.

(b') $p(t_1) \geq 0$ ($p(t_1) = 0$ if $x^*(t_1) > x^1$)

The *maximum principle*. The differential equation for $p(t)$ is not necessarily valid at the discontinuity points of $u^*(t)$. (4)(b') is called a *transversality condition*. (Except in degenerate cases, one can put $p_0 = 1$ and then ignore (1).)

Several state and control variables

$$\max \int_{t_0}^{t_1} f(t, \mathbf{x}(t), \mathbf{u}(t)) dt$$

$$\dot{\mathbf{x}}(t) = \mathbf{g}(t, \mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(t_0) = \mathbf{x}^0$$

$$16.24 \quad \mathbf{u}(t) = (u_1(t), \dots, u_r(t)) \in U \subset \mathbb{R}^r$$

$$(a) \quad x_i(t_1) = x_i^1, \quad i = 1, \dots, l$$

$$(b) \quad x_i(t_1) \geq x_i^1, \quad i = l + 1, \dots, q$$

$$(c) \quad x_i(t_1) \text{ free}, \quad i = q + 1, \dots, n$$

A standard control problem with fixed time interval. U is the control region, $\mathbf{x}(t) = (x_1(t), \dots, x_n(t))$, $\mathbf{g} = (g_1, \dots, g_n)$. $\mathbf{u}(t)$ is piecewise continuous.

$$16.25 \quad H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}) = p_0 f(t, \mathbf{x}, \mathbf{u}) + \sum_{i=1}^n p_i g_i(t, \mathbf{x}, \mathbf{u})$$

The *Hamiltonian*.

If $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves problem (16.24), there exist a constant p_0 and a continuous function $\mathbf{p}(t) = (p_1(t), \dots, p_n(t))$, such that for all t in $[t_0, t_1]$,

$$(1) \quad p_0 = 0 \text{ or } 1 \text{ and } (p_0, \mathbf{p}(t)) \text{ is never } (0, \mathbf{0}).$$

$$16.26 \quad (2) \quad H(t, \mathbf{x}^*(t), \mathbf{u}, \mathbf{p}(t)) \leq H(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{p}(t))$$

for all \mathbf{u} in U .

$$(3) \quad \dot{p}_i(t) = -\partial H^*/\partial x_i, \quad i = 1, \dots, n$$

$$(4) \quad (a') \text{ No condition on } p_i(t_1), \quad i = 1, \dots, l$$

$$(b') \quad p_i(t_1) \geq 0 \quad (= 0 \text{ if } x_i^*(t_1) > x_i^1)$$

$$i = l + 1, \dots, q$$

$$(c') \quad p_i(t_1) = 0, \quad i = q + 1, \dots, n$$

The *maximum principle*. H^* denotes evaluation at $(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{p}(t))$. The differential equation for $p_i(t)$ is not necessarily valid at the discontinuity points of $\mathbf{u}^*(t)$. (4) (b') and (c') are *transversality conditions*. (Except in degenerate cases, one can put $p_0 = 1$ and then ignore (1).)

16.27 If $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ satisfies all the conditions in (16.26) for $p_0 = 1$, and $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}(t))$ is concave in (\mathbf{x}, \mathbf{u}) , then $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves problem (16.24).

Mangasarian's sufficient conditions for problem (16.24).

16.28 The condition in (16.27) that $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}(t))$ is concave in (\mathbf{x}, \mathbf{u}) , can be replaced by the weaker condition that the *maximized Hamiltonian*

$$\hat{H}(t, \mathbf{x}, \mathbf{p}(t)) = \max_{\mathbf{u} \in U} H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}(t))$$

is concave in \mathbf{x} .

Arrow's sufficient condition.

$$16.29 \quad V(\mathbf{x}^0, \mathbf{x}^1, t_0, t_1) = \int_{t_0}^{t_1} f(t, \mathbf{x}^*(t), \mathbf{u}^*(t)) dt$$

The *value function* of problem (16.24), assuming that the solution is $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ and that $\mathbf{x}^1 = (x_1^1, \dots, x_q^1)$.

$$\begin{aligned}
 & \frac{\partial V}{\partial x_i^0} = p_i(t_0), \quad i = 1, \dots, n \\
 16.30 \quad & \frac{\partial V}{\partial x_i^1} = -p_i(t_1), \quad i = 1, \dots, q \\
 & \frac{\partial V}{\partial t_0} = -H^*(t_0), \quad \frac{\partial V}{\partial t_1} = H^*(t_1)
 \end{aligned}$$

Properties of the value function, assuming V is differentiable. $H^*(t) = H(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{p}(t))$. (For precise assumptions, see Seierstad and Sydsæter (1987), Sec. 3.5.)

16.31 If t_1 is free in problem (16.24) and $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves the corresponding problem on $[t_0, t_1^*]$, then all the conditions in (16.26) are satisfied on $[t_0, t_1^*]$, and in addition

$$H(t_1^*, \mathbf{x}^*(t_1^*), \mathbf{u}^*(t_1^*), \mathbf{p}(t_1^*)) = 0$$

Necessary conditions for a free terminal time problem. (Concavity of the Hamiltonian in (\mathbf{x}, \mathbf{u}) is *not* sufficient for optimality when t_1 is free. See Seierstad and Sydsæter (1987), Sec. 2.9.)

Replace the terminal conditions (a), (b), and (c) in problem (16.24) by

$$\begin{aligned}
 R_k(\mathbf{x}(t_1)) &= 0, \quad k = 1, 2, \dots, r'_1, \\
 R_k(\mathbf{x}(t_1)) &\geq 0, \quad k = r'_1 + 1, r'_1 + 2, \dots, r_1,
 \end{aligned}$$

where R_1, \dots, R_{r_1} are C^1 functions. If the pair $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ is optimal, then the conditions in (16.26) are satisfied, except that (4) is replaced by the condition that there exist numbers a_1, \dots, a_{r_1} such that

$$16.32 \quad p_j(t_1) = \sum_{k=1}^{r_1} a_k \frac{\partial R_k(\mathbf{x}^*(t_1))}{\partial x_j}, \quad j = 1, \dots, n$$

where $a_k \geq 0$ ($a_k = 0$ if $R_k(\mathbf{x}^*(t_1)) > 0$) for $k = r'_1 + 1, \dots, r_1$, and (1) is replaced by

$$p_0 = 0 \text{ or } 1, \quad (p_0, a_1, \dots, a_{r_1}) \neq (0, 0, \dots, 0)$$

If $\widehat{H}(t, \mathbf{x}, \mathbf{p}(t))$ is concave in \mathbf{x} for $p_0 = 1$ and the sum $\sum_{k=1}^{r_1} a_k R_k(\mathbf{x})$ is quasi-concave in \mathbf{x} , then $(\mathbf{x}^*, \mathbf{u}^*)$ is optimal.

More general terminal conditions. $\widehat{H}(t, \mathbf{x}, \mathbf{p}(t))$ is defined in (16.28).

$$\begin{aligned}
 16.33 \quad & \max \left[\int_{t_0}^{t_1} f(t, \mathbf{x}(t), \mathbf{u}(t)) e^{-rt} dt + S(t_1, \mathbf{x}(t_1)) e^{-rt_1} \right] \\
 & \dot{\mathbf{x}}(t) = \mathbf{g}(t, \mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(t_0) = \mathbf{x}^0, \quad \mathbf{u}(t) \in U \subset \mathbb{R}^r \\
 & \text{(a) } x_i(t_1) = x_i^1, \quad i = 1, \dots, l \\
 & \text{(b) } x_i(t_1) \geq x_i^1, \quad i = l + 1, \dots, q \\
 & \text{(c) } x_i(t_1) \text{ free,} \quad i = q + 1, \dots, n
 \end{aligned}$$

A control problem with a scrap value function, S . t_0 and t_1 are fixed.

$$16.34 \quad H^c(t, \mathbf{x}, \mathbf{u}, \mathbf{q}) = q_0 f(t, \mathbf{x}, \mathbf{u}) + \sum_{j=1}^n q_j g_j(t, \mathbf{x}, \mathbf{u})$$

The *current value Hamiltonian* for problem (16.33).

If $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves problem (16.33), there exists a constant q_0 and a continuous function $\mathbf{q}(t) = (q_1(t), \dots, q_n(t))$ such that for all t in $[t_0, t_1]$,

- (1) $q_0 = 0$ or 1 and $(q_0, \mathbf{q}(t))$ is never $(0, \mathbf{0})$.
 (2) $H^c(t, \mathbf{x}^*(t), \mathbf{u}, \mathbf{q}(t)) \leq H^c(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{q}(t))$
 for all \mathbf{u} in U .

$$16.35 \quad (3) \quad \dot{q}_i - r q_i = -\frac{\partial H^c(t, \mathbf{x}^*, \mathbf{u}^*, \mathbf{q})}{\partial x_i}, \quad i = 1, \dots, n$$

(4)

(a') No condition on $q_i(t_1)$, $i = 1, \dots, l$

(b') $q_i(t_1) \geq q_0 \frac{\partial S^*(t_1, \mathbf{x}^*(t_1))}{\partial x_i}$

(with $=$ if $x_i^*(t_1) > x_i^1$), $i = l + 1, \dots, m$

(c') $q_i(t_1) = q_0 \frac{\partial S^*(t_1, \mathbf{x}^*(t_1))}{\partial x_i}$, $i = m + 1, \dots, n$

The maximum principle for problem (16.33), *current value formulation*.

The differential equation for $q_i = q_i(t)$ is not necessarily valid at the discontinuity points of $\mathbf{u}^*(t)$. (Except in degenerate cases, one can put $q_0 = 1$ and then ignore (1).)

16.36 If $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ satisfies the conditions in (16.35) for $q_0 = 1$, if $H^c(t, \mathbf{x}, \mathbf{u}, \mathbf{q}(t))$ is concave in (\mathbf{x}, \mathbf{u}) , and if $S(t, \mathbf{x})$ is concave in \mathbf{x} , then the pair $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves the problem.

Sufficient conditions for the solution of (16.33). (Mangasarian.)

16.37 The condition in (16.36) that $H^c(t, \mathbf{x}, \mathbf{u}, \mathbf{q}(t))$ is concave in (\mathbf{x}, \mathbf{u}) can be replaced by the weaker condition that the *maximized current value Hamiltonian*

$$\hat{H}^c(t, \mathbf{x}, \mathbf{q}(t)) = \max_{\mathbf{u} \in U} H^c(t, \mathbf{x}, \mathbf{u}, \mathbf{q}(t))$$

is concave in \mathbf{x} .

Arrow's sufficient condition.

16.38 If t_1 is free in problem (16.33), and if $(\mathbf{x}^*, \mathbf{u}^*)$ solves the corresponding problem on $[t_0, t_1^*]$, then all the conditions in (16.35) are satisfied on $[t_0, t_1^*]$, and in addition

$$H^c(t_1^*, \mathbf{x}^*(t_1^*), \mathbf{u}^*(t_1^*), \mathbf{q}(t_1^*)) = q_0 r S(t_1^*, \mathbf{x}^*(t_1^*)) - q_0 \frac{\partial S(t_1^*, \mathbf{x}^*(t_1^*))}{\partial t_1}$$

Necessary conditions for problem (16.33) when t_1 is free. (Except in degenerate cases, one can put $q_0 = 1$.)

Linear quadratic problems

$$16.39 \quad \min \left[\int_{t_0}^{t_1} (\mathbf{x}' \mathbf{A} \mathbf{x} + \mathbf{u}' \mathbf{B} \mathbf{u}) dt + (\mathbf{x}(t_1))' \mathbf{S} \mathbf{x}(t_1) \right],$$

$$\dot{\mathbf{x}} = \mathbf{F} \mathbf{x} + \mathbf{G} \mathbf{u}, \quad \mathbf{x}(t_0) = \mathbf{x}^0, \quad \mathbf{u} \in \mathbb{R}^r.$$

The matrices $\mathbf{A} = \mathbf{A}(t)_{n \times n}$ and $\mathbf{S}_{n \times n}$ are symmetric and positive semidefinite, $\mathbf{B} = \mathbf{B}(t)_{r \times r}$ is symmetric and positive definite, $\mathbf{F} = \mathbf{F}(t)_{n \times n}$ and $\mathbf{G} = \mathbf{G}(t)_{n \times r}$.

A linear quadratic control problem. The entries of $\mathbf{A}(t)$, $\mathbf{B}(t)$, $\mathbf{F}(t)$, and $\mathbf{G}(t)$ are continuous functions of t . $\mathbf{x} = \mathbf{x}(t)$ is $n \times 1$, $\mathbf{u} = \mathbf{u}(t)$ is $r \times 1$.

$$16.40 \quad \dot{\mathbf{R}} = -\mathbf{R}\mathbf{F} - \mathbf{F}'\mathbf{R} + \mathbf{R}\mathbf{G}\mathbf{B}^{-1}\mathbf{G}'\mathbf{R} - \mathbf{A}$$

The Riccati equation associated with (16.39).

$$16.41 \quad \text{Suppose } (\mathbf{x}^*(t), \mathbf{u}^*(t)) \text{ is admissible in problem (16.39), and let } \mathbf{u}^* = -(\mathbf{B}(t))^{-1}(\mathbf{G}(t))'\mathbf{R}(t)\mathbf{x}^*,$$

with $\mathbf{R} = \mathbf{R}(t)$ as a symmetric $n \times n$ -matrix with C^1 entries satisfying (16.40) with $\mathbf{R}(t_1) = \mathbf{S}$. Then $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves problem (16.39).

The solution of (16.39).

Infinite horizon

$$16.42 \quad \max \int_{t_0}^{\infty} f(t, x(t), u(t)) e^{-rt} dt,$$

$$\dot{x}(t) = g(t, x(t), u(t)), \quad x(t_0) = x^0, \quad u(t) \in U,$$

$$\lim_{t \rightarrow \infty} x(t) \geq x^1 \quad (x^1 \text{ is a fixed number}).$$

A simple one-variable infinite horizon problem, assuming that the integral converges for all admissible pairs.

$$16.43 \quad H^c(t, x, u, q) = q_0 f(t, x, u) + q g(t, x, u)$$

The current value Hamiltonian for problem (16.42).

Suppose that, with $q_0 = 1$, an admissible pair $(x^*(t), u^*(t))$ in problem (16.42) satisfies the following conditions for all $t \geq t_0$:

$$16.44 \quad (1) \quad H^c(t, x^*(t), u, q(t)) \leq H^c(t, x^*(t), u^*(t), q(t))$$

for all u in U .

$$(2) \quad \dot{q}(t) - rq = -\partial H^c(t, x^*(t), u^*(t), q(t)) / \partial x$$

$$(3) \quad H^c(t, x, u, q(t)) \text{ is concave in } (x, u).$$

$$(4) \quad \lim_{t \rightarrow \infty} [q(t) e^{-rt} (x(t) - x^*(t))] \geq 0 \text{ for all admissible } x(t).$$

Mangasarian's sufficient conditions. (Conditions (1) and (2) are essentially) necessary for problem (16.42), but (4) is not. For a discussion of necessary conditions, see e.g. Seierstad and Sydsæter (1987), Sec. 3.7.)

Then $(x^*(t), u^*(t))$ is optimal.

$$\begin{aligned}
 & \max \int_{t_0}^{\infty} f(t, \mathbf{x}(t), \mathbf{u}(t)) e^{-rt} dt \\
 16.45 \quad & \dot{\mathbf{x}}(t) = \mathbf{g}(t, \mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(t_0) = \mathbf{x}^0, \quad \mathbf{u}(t) \in U \subset \mathbb{R}^r \\
 & \text{(a) } \underline{\lim}_{t \rightarrow \infty} x_i(t) = x_i^1, \quad i = 1, \dots, l \\
 & \text{(b) } \underline{\lim}_{t \rightarrow \infty} x_i(t) \geq x_i^1, \quad i = l + 1, \dots, m \\
 & \text{(c) } x_i(t) \text{ free as } t \rightarrow \infty, \quad i = m + 1, \dots, n
 \end{aligned}$$

An infinite horizon problem with several state and control variables. For $\underline{\lim}$, see (12.42) and (12.43).

$$\begin{aligned}
 16.46 \quad & D(t) = \int_{t_0}^t (f^* - f) e^{-r\tau} d\tau, \quad \text{where} \\
 & f^* = f(\tau, \mathbf{x}^*(\tau), \mathbf{u}^*(\tau)), \quad f = f(\tau, \mathbf{x}(\tau), \mathbf{u}(\tau))
 \end{aligned}$$

Notation for (16.47). $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ is a candidate for optimality, and $(\mathbf{x}(t), \mathbf{u}(t))$ is any admissible pair.

The pair $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ is

- *sporadically catching up optimal* (SCU-optimal) if for every admissible pair $(\mathbf{x}(t), \mathbf{u}(t))$,

$$\overline{\lim}_{t \rightarrow \infty} D(t) \geq 0$$
 i.e. for every $\varepsilon > 0$ and every T there is some $t \geq T$ such that $D(t) \geq -\varepsilon$;
- 16.47 • *catching up optimal* (CU-optimal) if for every admissible pair $(\mathbf{x}(t), \mathbf{u}(t))$,

$$\underline{\lim}_{t \rightarrow \infty} D(t) \geq 0$$
 i.e. for every $\varepsilon > 0$ there exists a T such that $D(t) \geq -\varepsilon$ for all $t \geq T$;
- *overtaking optimal* (OT-optimal) if for every admissible pair $(\mathbf{x}(t), \mathbf{u}(t))$, there exists a number T such that $D(t) \geq 0$ for all $t \geq T$.

Different optimality criteria for infinite horizon problems. For $\underline{\lim}$ and $\overline{\lim}$, see (12.42) and (12.43). (SCU-optimality is also called *weak optimality*, while CU-optimality is then called *overtaking optimality*.)

$$\begin{aligned}
 16.48 \quad & \text{OT-optimality} \Rightarrow \text{CU-optimality} \\
 & \Rightarrow \text{SCU-optimality}
 \end{aligned}$$

Relationship between the optimality criteria.

- Suppose $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ is SCU-, CU-, or OT-optimal in problem (16.45). Then there exist a constant q_0 and a continuous function $\mathbf{q}(t) = (q_1(t), \dots, q_n(t))$ such that for all $t \geq t_0$,
- 16.49 (1) $q_0 = 0$ or 1 and $(q_0, \mathbf{q}(t))$ is never $(0, \mathbf{0})$.
 - (2) $H^c(t, \mathbf{x}^*(t), \mathbf{u}, \mathbf{q}(t)) \leq H^c(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{q}(t))$ for all \mathbf{u} in U .
 - (3) $\dot{q}_i - r q_i = -\frac{\partial H^c(t, \mathbf{x}^*, \mathbf{u}^*, \mathbf{q})}{\partial x_i}, \quad i = 1, \dots, n$

The maximum principle. Infinite horizon. (No transversality condition.) The differential equation for $q_i(t)$ is not necessarily valid at the discontinuity points of $\mathbf{u}^*(t)$.

With regard to CU-optimality, conditions (2) and (3) in (16.49) (with $q_0 = 1$) are sufficient for optimality if

16.50

- (1) $H^c(t, \mathbf{x}, \mathbf{u}, \mathbf{q}(t))$ is concave in (\mathbf{x}, \mathbf{u})
- (2) $\underline{\lim}_{t \rightarrow \infty} e^{-rt} \mathbf{q}(t) \cdot (\mathbf{x}(t) - \mathbf{x}^*(t)) \geq 0$ for all admissible $\mathbf{x}(t)$.

Sufficient conditions for the infinite horizon case.

Condition (16.50) (2) is satisfied if the following conditions are satisfied for all admissible $\mathbf{x}(t)$:

16.51

- (1) $\underline{\lim}_{t \rightarrow \infty} e^{-rt} q_i(t)(x_i^1 - x_i^*(t)) \geq 0$, $i = 1, \dots, m$.
- (2) There exists a constant M such that $|e^{-rt} q_i(t)| \leq M$ for all $t \geq t_0$, $i = 1, \dots, m$.
- (3) Either there exists a number $t' \geq t_0$ such that $q_i(t) \geq 0$ for all $t \geq t'$, or there exists a number P such that $|x_i(t)| \leq P$ for all $t \geq t_0$ and $\underline{\lim}_{t \rightarrow \infty} q_i(t) \geq 0$, $i = l + 1, \dots, m$.
- (4) There exists a number Q such that $|x_i(t)| < Q$ for all $t \geq t_0$, and $\lim_{t \rightarrow \infty} q_i(t) = 0$, $i = m + 1, \dots, n$.

Sufficient conditions for (16.50) (2) to hold. See Seierstad and Sydsæter (1987), Section 3.7, Note 16.

Mixed constraints

$$\max \int_{t_0}^{t_1} f(t, \mathbf{x}(t), \mathbf{u}(t)) dt$$

$$\dot{\mathbf{x}}(t) = \mathbf{g}(t, \mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(t_0) = \mathbf{x}^0, \quad \mathbf{u}(t) \in \mathbb{R}^r$$

16.52

$$h_k(t, \mathbf{x}(t), \mathbf{u}(t)) \geq 0, \quad k = 1, \dots, s$$

- (a) $x_i(t_1) = x_i^1$, $i = 1, \dots, l$
- (b) $x_i(t_1) \geq x_i^1$, $i = l + 1, \dots, q$
- (c) $x_i(t_1)$ free, $i = q + 1, \dots, n$

A mixed constraints problem. $\mathbf{x}(t) \in \mathbb{R}^n$. h_1, \dots, h_s are given functions. (All restrictions on \mathbf{u} must be included in the h_k constraints.)

16.53

$$\mathcal{L}(t, \mathbf{x}, \mathbf{u}, \mathbf{p}, \mathbf{q}) = H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}) + \sum_{k=1}^s q_k h_k(t, \mathbf{x}, \mathbf{u})$$

The Lagrangian associated with (16.52). $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p})$ is the usual Hamiltonian.

Suppose $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ is an admissible pair in problem (16.52). Suppose further that there exist functions $\mathbf{p}(t) = (p_1(t), \dots, p_n(t))$ and $\mathbf{q}(t) = (q_1(t), \dots, q_s(t))$, where $\mathbf{p}(t)$ is continuous and $\dot{\mathbf{p}}(t)$ and $\mathbf{q}(t)$ are piecewise continuous, such that the following conditions are satisfied with $p_0 = 1$:

- 16.54
- (1) $\frac{\partial \mathcal{L}^*}{\partial u_j} = 0, \quad j = 1, \dots, r$
 - (2) $q_k(t) \geq 0$ ($q_k(t) = 0$ if $h_k(t, \mathbf{x}^*(t), \mathbf{u}^*(t)) > 0$),
 $k = 1, \dots, s$
 - (3) $\dot{p}_i(t) = -\frac{\partial \mathcal{L}^*}{\partial x_i}, \quad i = 1, \dots, n$
 - (4)
 - (a') No conditions on $p_i(t_1), \quad i = 1, \dots, l$
 - (b') $p_i(t_1) \geq 0$ ($p_i(t_1) = 0$ if $x_i^*(t_1) > x_i^1$),
 $i = l + 1, \dots, m$
 - (c') $p_i(t_1) = 0, \quad i = m + 1, \dots, n$
 - (5) $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}(t))$ is concave in (\mathbf{x}, \mathbf{u})
 - (6) $h_k(t, \mathbf{x}, \mathbf{u})$ is quasi-concave in (\mathbf{x}, \mathbf{u}) ,
 $k = 1, \dots, s$

Then $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves the problem.

Mangasarian's sufficient conditions for problem (16.52). \mathcal{L}^* denotes evaluation at $(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{p}(t), \mathbf{q}(t))$. (The standard *necessary* conditions for optimality involve a constraint qualification that severely restricts the type of functions that can appear in the h_k -constraints. In particular, each constraint active at the optimum must contain at least one of the control variables as an argument. For details, see the references.)

Pure state constraints

- 16.55
- $$\max \int_{t_0}^{t_1} f(t, \mathbf{x}(t), \mathbf{u}(t)) dt$$
- $$\dot{\mathbf{x}}(t) = \mathbf{g}(t, \mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(t_0) = \mathbf{x}^0$$
- $$\mathbf{u}(t) = (u_1(t), \dots, u_r(t)) \in U \subset \mathbb{R}^r$$
- $$h_k(t, \mathbf{x}(t)) \geq 0, \quad k = 1, \dots, s$$
- (a) $x_i(t_1) = x_i^1, \quad i = 1, \dots, l$
 - (b) $x_i(t_1) \geq x_i^1, \quad i = l + 1, \dots, q$
 - (c) $x_i(t_1)$ free, $i = q + 1, \dots, n$

A pure state constraints problem. U is the control region. h_1, \dots, h_s are given functions.

- 16.56 $\mathcal{L}(t, \mathbf{x}, \mathbf{u}, \mathbf{p}, \mathbf{q}) = H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}) + \sum_{k=1}^s q_k h_k(t, \mathbf{x})$

The Lagrangian associated with (16.55). $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p})$ is the usual Hamiltonian.

Suppose $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ is admissible in problem (16.55), and that there exist vector functions $\mathbf{p}(t)$ and $\mathbf{q}(t)$, where $\mathbf{p}(t)$ is continuous and $\dot{\mathbf{p}}(t)$ and $\mathbf{q}(t)$ are piecewise continuous in $[t_0, t_1]$, and numbers $\beta_k, k = 1, \dots, s$, such that the following conditions are satisfied with $p_0 = 1$:

- (1) $\mathbf{u} = \mathbf{u}^*(t)$ maximizes $H(t, \mathbf{x}^*(t), \mathbf{u}, \mathbf{p}(t))$ for \mathbf{u} in U .
- (2) $q_k(t) \geq 0$ ($q_k(t) = 0$ if $h_k(t, \mathbf{x}^*(t)) > 0$),
 $k = 1, \dots, s$
- (3) $\dot{p}_i(t) = -\frac{\partial \mathcal{L}^*}{\partial x_i},$ $i = 1, \dots, n$
- (4) At $t_1, p_i(t)$ can have a jump discontinuity, in which case

$$p_i(t_1^-) - p_i(t_1) = \sum_{k=1}^s \beta_k \frac{\partial h_k(t_1, \mathbf{x}^*(t_1))}{\partial x_i},$$
 $i = 1, \dots, n$
- (5) $\beta_k \geq 0$ ($\beta_k = 0$ if $h_k(t_1, \mathbf{x}^*(t_1)) > 0$),
 $k = 1, \dots, s$
- (6) (a') No conditions on $p_i(t_1),$ $i = 1, \dots, l$
 (b') $p_i(t_1) \geq 0$ ($p_i(t_1) = 0$ if $x_i^*(t_1) > x_i^1$),
 $i = l + 1, \dots, m$
 (c') $p_i(t_1) = 0,$ $i = m + 1, \dots, n$
- (7) $\hat{H}(t, \mathbf{x}, \mathbf{p}(t)) = \max_{\mathbf{u} \in U} H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}(t))$ is concave in \mathbf{x} .
- (8) $h_k(t, \mathbf{x})$ is quasi-concave in $\mathbf{x},$ $k = 1, \dots, s$
- Then $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves the problem.

16.57

Mangasarian's sufficient conditions for the pure state constraints problem (16.55). $\mathbf{p}(t) = (p_1(t), \dots, p_n(t))$ and $\mathbf{q}(t) = (q_1(t), \dots, q_s(t))$. \mathcal{L}^ denotes evaluation at $(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{p}(t), \mathbf{q}(t))$. (The conditions in the theorem are somewhat restrictive. In particular, sometimes one must allow $\mathbf{p}(t)$ to have discontinuities at interior points of $[t_0, t_1]$. For details, see the references.)*

Mixed and pure state constraints

$$\max \int_{t_0}^{t_1} f(t, \mathbf{x}(t), \mathbf{u}(t)) dt$$

$$\dot{\mathbf{x}}(t) = \mathbf{g}(t, \mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(t_0) = \mathbf{x}^0$$

$$\mathbf{u}(t) = (u_1(t), \dots, u_r(t)) \in U \subset \mathbb{R}^r$$

- 16.58 $h_k(t, \mathbf{x}(t), \mathbf{u}(t)) \geq 0,$ $k = 1, \dots, s'$
 $h_k(t, \mathbf{x}(t), \mathbf{u}(t)) = \bar{h}_k(t, \mathbf{x}(t)) \geq 0, k = s' + 1, \dots, s$
- (a) $x_i(t_1) = x_i^1, \quad i = 1, \dots, l$
 (b) $x_i(t_1) \geq x_i^1, \quad i = l + 1, \dots, q$
 (c) $x_i(t_1)$ free, $i = q + 1, \dots, n$

A mixed and pure state constraints problem.

Let $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ be admissible in problem (16.58). Assume that there exist vector functions $\mathbf{p}(t)$ and $\mathbf{q}(t)$, where $\mathbf{p}(t)$ is continuous and $\dot{\mathbf{p}}(t)$ and $\mathbf{q}(t)$ are piecewise continuous, and also numbers $\beta_k, k = 1, \dots, s$, such that the following conditions are satisfied with $p_0 = 1$:

- 16.59
- (1) $\left(\frac{\partial \mathcal{L}^*}{\partial \mathbf{u}}\right) \cdot (\mathbf{u} - \mathbf{u}^*(t)) \leq 0$ for all $\mathbf{u} \in U$
 - (2) $\dot{p}_i(t) = -\frac{\partial \mathcal{L}^*}{\partial x_i}, \quad i = 1, \dots, n$
 - (3) $p_i(t_1) - \sum_{k=1}^s \beta_k \frac{\partial h_k(t_1, \mathbf{x}^*(t_1), \mathbf{u}^*(t_1))}{\partial x_i}$
satisfies
 - (a') no conditions, $i = 1, \dots, l$
 - (b') ≥ 0 ($= 0$ if $x_i^*(t_1) > x_i^1$), $i = l + 1, \dots, m$
 - (c') $= 0$, $i = m + 1, \dots, n$
 - (4) $\beta_k = 0, \quad k = 1, \dots, s'$
 - (5) $\beta_k \geq 0$ ($\beta_k = 0$ if $\bar{h}_k(t_1, \mathbf{x}^*(t_1)) > 0$), $k = s' + 1, \dots, s$
 - (6) $q_k(t) \geq 0$ ($= 0$ if $h_k(t, \mathbf{x}^*(t), \mathbf{u}^*(t)) > 0$), $k = 1, \dots, s$
 - (7) $h_k(t, \mathbf{x}, \mathbf{u})$ is quasi-concave in (\mathbf{x}, \mathbf{u}) , $k = 1, \dots, s$
 - (8) $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}(t))$ is concave in (\mathbf{x}, \mathbf{u}) .

Then $(\mathbf{x}^*(t), \mathbf{u}^*(t))$ solves the problem.

Mangasarian's sufficient conditions for the mixed and pure state constraints problem (with $\mathbf{p}(t)$ continuous). \mathcal{L} is defined in (16.53), and \mathcal{L}^* denotes evaluation at $(t, \mathbf{x}^*(t), \mathbf{u}^*(t), \mathbf{p}(t), \mathbf{q}(t))$. $\mathbf{p}(t) = (p_1(t), \dots, p_n(t))$, $\mathbf{q}(t) = (q_1(t), \dots, q_s(t))$. A constraint qualification is not required, but the conditions often fail to hold because $\mathbf{p}(t)$ has discontinuities, in particular at t_1 . See e.g. Seierstad and Sydsæter (1987), Theorem 6.2 for a sufficiency result allowing $\mathbf{p}(t)$ to have discontinuities at interior points of $[t_0, t_1]$ as well.

Chapter 17

Discrete dynamic optimization

Dynamic programming

$$\begin{aligned}
 17.1 \quad & \max \sum_{t=0}^T f(t, \mathbf{x}_t, \mathbf{u}_t) \\
 & \mathbf{x}_{t+1} = \mathbf{g}(t, \mathbf{x}_t, \mathbf{u}_t), \quad t = 0, \dots, T-1 \\
 & \mathbf{x}_0 = \mathbf{x}^0, \quad \mathbf{x}_t \in \mathbb{R}^n, \quad \mathbf{u}_t \in U \subset \mathbb{R}^r, \quad t = 0, \dots, T
 \end{aligned}$$

A *dynamic programming problem*. Here $\mathbf{g} = (g_1, \dots, g_n)$, and \mathbf{x}^0 is a fixed vector in \mathbb{R}^n . U is the *control region*.

$$\begin{aligned}
 17.2 \quad & J_s(\mathbf{x}) = \max_{\mathbf{u}_s, \dots, \mathbf{u}_T \in U} \sum_{t=s}^T f(t, \mathbf{x}_t, \mathbf{u}_t), \text{ where} \\
 & \mathbf{x}_{t+1} = \mathbf{g}(t, \mathbf{x}_t, \mathbf{u}_t), \quad t = s, \dots, T-1, \quad \mathbf{x}_s = \mathbf{x}
 \end{aligned}$$

Definition of the *value function*, $J_s(\mathbf{x})$, of problem (17.1).

$$\begin{aligned}
 17.3 \quad & J_T(\mathbf{x}) = \max_{\mathbf{u} \in U} f(T, \mathbf{x}, \mathbf{u}) \\
 & J_s(\mathbf{x}) = \max_{\mathbf{u} \in U} [f(s, \mathbf{x}, \mathbf{u}) + J_{s+1}(\mathbf{g}(s, \mathbf{x}, \mathbf{u}))] \\
 & \text{for } s = 0, 1, \dots, T-1.
 \end{aligned}$$

The *fundamental equations* in dynamic programming. (Bellman's equations.)

A "control parameter free" formulation of the dynamic programming problem:

$$\begin{aligned}
 17.4 \quad & \max \sum_{t=0}^T F(t, \mathbf{x}_t, \mathbf{x}_{t+1}) \\
 & \mathbf{x}_{t+1} \in \Gamma_t(\mathbf{x}_t), \quad t = 0, \dots, T, \quad \mathbf{x}_0 \text{ given}
 \end{aligned}$$

The set $\Gamma_t(\mathbf{x}_t)$ is often defined in terms of vector inequalities, $\mathbf{G}(t, \mathbf{x}_t) \leq \mathbf{x}_{t+1} \leq \mathbf{H}(t, \mathbf{x}_t)$, for given vector functions \mathbf{G} and \mathbf{H} .

$$\begin{aligned}
 17.5 \quad & J_s(\mathbf{x}) = \max \sum_{t=s}^T F(t, \mathbf{x}_t, \mathbf{x}_{t+1}), \text{ where the maximum is taken over all } \mathbf{x}_{t+1} \text{ in } \Gamma_t(\mathbf{x}_t) \text{ for } t = s, \dots, T, \text{ with } \mathbf{x}_s = \mathbf{x}.
 \end{aligned}$$

The *value function*, $J_s(\mathbf{x})$, of problem (17.4).

$$\begin{aligned}
 17.6 \quad & J_T(\mathbf{x}) = \max_{\mathbf{y} \in \Gamma_T(\mathbf{x})} F(T, \mathbf{x}, \mathbf{y}) \\
 & J_s(\mathbf{x}) = \max_{\mathbf{y} \in \Gamma_s(\mathbf{x})} [F(s, \mathbf{x}, \mathbf{y}) + J_{s+1}(\mathbf{y})] \\
 & \text{for } s = 0, 1, \dots, T.
 \end{aligned}$$

The *fundamental equations* for problem (17.4).

17.7 If $\{\mathbf{x}_0^*, \dots, \mathbf{x}_{T+1}^*\}$ is an optimal solution of problem (17.4) in which \mathbf{x}_{t+1}^* is an interior point of $\Gamma_t(\mathbf{x}_t^*)$ for all t , and if the correspondence $\mathbf{x} \mapsto \Gamma_t(\mathbf{x})$ is upper hemicontinuous, then $\{\mathbf{x}_0^*, \dots, \mathbf{x}_{T+1}^*\}$ satisfies the *Euler vector difference equation*

$$F'_2(t+1, \mathbf{x}_{t+1}, \mathbf{x}_{t+2}) + F'_3(t, \mathbf{x}_t, \mathbf{x}_{t+1}) = 0$$

F is a function of $1 + n + n$ variables, F'_2 denotes the n -vector of partial derivatives of F w.r.t. variables no. $2, 3, \dots, n+1$, and F'_3 is the n -vector of partial derivatives of F w.r.t. variables no. $n+2, n+3, \dots, 2n+1$.

Infinite horizon

17.8
$$\max \sum_{t=0}^{\infty} \alpha^t f(\mathbf{x}_t, \mathbf{u}_t)$$

 $\mathbf{x}_{t+1} = \mathbf{g}(\mathbf{x}_t, \mathbf{u}_t), \quad t = 0, 1, 2, \dots$
 $\mathbf{x}_0 = \mathbf{x}^0, \quad \mathbf{x}_t \in \mathbb{R}^n, \quad \mathbf{u}_t \in U \subset \mathbb{R}^r, \quad t = 0, 1, 2, \dots$

An infinite horizon problem. $\alpha \in (0, 1)$ is a constant discount factor.

17.9 The sequence $\{(\mathbf{x}_t, \mathbf{u}_t)\}$ is called *admissible* if $\mathbf{u}_t \in U$, $\mathbf{x}_0 = \mathbf{x}^0$, and the difference equation in (17.8) is satisfied for all $t = 0, 1, 2, \dots$

Definition of an *admissible* sequence.

17.10 (B) $M \leq f(\mathbf{x}, \mathbf{u}) \leq N$
 (BB) $f(\mathbf{x}, \mathbf{u}) \geq M$
 (BA) $f(\mathbf{x}, \mathbf{u}) \leq N$

Boundedness conditions. M and N are given numbers.

17.11
$$V(\mathbf{x}, \boldsymbol{\pi}, s, \infty) = \sum_{t=s}^{\infty} \alpha^t f(\mathbf{x}_t, \mathbf{u}_t),$$

 where $\boldsymbol{\pi} = (\mathbf{u}_s, \mathbf{u}_{s+1}, \dots)$, with $\mathbf{u}_{s+k} \in U$ for $k = 0, 1, \dots$, and with $\mathbf{x}_{t+1} = \mathbf{g}(\mathbf{x}_t, \mathbf{u}_t)$ for $t = s, s+1, \dots$, and with $\mathbf{x}_s = \mathbf{x}$.

The *total utility* obtained from period s and onwards, given that the state vector is \mathbf{x} at $t = s$.

17.12
$$J_s(\mathbf{x}) = \sup_{\boldsymbol{\pi}} V(\mathbf{x}, \boldsymbol{\pi}, s, \infty)$$

 where the supremum is taken over all vectors $\boldsymbol{\pi} = (\mathbf{u}_s, \mathbf{u}_{s+1}, \dots)$ with $\mathbf{u}_{s+k} \in U$, with $(\mathbf{x}_t, \mathbf{u}_t)$ admissible for $t \geq s$, and with $\mathbf{x}_s = \mathbf{x}$.

The *value function* of problem (17.8).

17.13
$$J_s(\mathbf{x}) = \alpha^s J_0(\mathbf{x}), \quad s = 1, 2, \dots$$

$$J_0(\mathbf{x}) = \sup_{\mathbf{u} \in U} \{f(\mathbf{x}, \mathbf{u}) + \alpha J_0(\mathbf{g}(\mathbf{x}, \mathbf{u}))\}$$

Properties of the value function, assuming that at least one of the boundedness conditions in (17.10) is satisfied.

Discrete optimal control theory

$$17.14 \quad H = f(t, \mathbf{x}, \mathbf{u}) + \mathbf{p} \cdot \mathbf{g}(t, \mathbf{x}, \mathbf{u}), \quad t = 0, \dots, T$$

Suppose $\{(\mathbf{x}_t^*, \mathbf{u}_t^*)\}$ is an optimal sequence for problem (17.1). Then there exist vectors \mathbf{p}_t in \mathbb{R}^n such that for $t = 0, \dots, T$:

- $$17.15 \quad \begin{aligned} &\bullet H'_{\mathbf{u}}(t, \mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t) \cdot (\mathbf{u} - \mathbf{u}_t^*) \leq 0 \text{ for all } \mathbf{u} \text{ in } U \\ &\bullet \text{ The vector } \mathbf{p}_t = (p_t^1, \dots, p_t^n) \text{ is a solution of} \\ &\quad \mathbf{p}_{t-1} = H'_{\mathbf{x}}(t, \mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t), \quad t = 1, \dots, T \\ &\quad \text{with } \mathbf{p}_T = \mathbf{0}. \end{aligned}$$

$$(a) \quad x_T^i = \bar{x}^i \quad \text{for } i = 1, \dots, l$$

$$17.16 \quad (b) \quad x_T^i \geq \bar{x}^i \quad \text{for } i = l + 1, \dots, m$$

$$(c) \quad x_T^i \text{ free} \quad \text{for } i = m + 1, \dots, n$$

$$17.17 \quad H = \begin{cases} q_0 f(t, \mathbf{x}, \mathbf{u}) + \mathbf{p} \cdot \mathbf{g}(t, \mathbf{x}, \mathbf{u}), & t = 0, \dots, T-1 \\ f(T, \mathbf{x}, \mathbf{u}), & t = T \end{cases}$$

Suppose $\{(\mathbf{x}_t^*, \mathbf{u}_t^*)\}$ is an optimal sequence for problem (17.1) with terminal conditions (17.16). Then there exist vectors \mathbf{p}_t in \mathbb{R}^n and a number q_0 , with $(q_0, \mathbf{p}_T) \neq (0, \mathbf{0})$ and with $q_0 = 0$ or 1, such that for $t = 0, \dots, T$:

- $$17.18 \quad \begin{aligned} (1) & H'_{\mathbf{u}}(t, \mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t) \cdot (\mathbf{u} - \mathbf{u}_t^*) \leq 0 \text{ for all } \mathbf{u} \text{ in } U \\ (2) & \mathbf{p}_t = (p_t^1, \dots, p_t^n) \text{ is a solution of} \\ & p_{t-1}^i = H'_{x^i}(t, \mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t), \quad t = 1, \dots, T-1 \\ (3) & p_{T-1}^i = q_0 \frac{\partial f(T, \mathbf{x}_T^*, \mathbf{u}_T^*)}{\partial x_T^i} + p_T^i \end{aligned}$$

where p_T^i satisfies

$$(a') \quad \text{no condition on } p_T^i, \quad i = 1, \dots, l$$

$$(b') \quad p_T^i \geq 0 \quad (= 0 \text{ if } x_T^{*i} > \bar{x}^i), \quad i = l + 1, \dots, m$$

$$(c') \quad p_T^i = 0, \quad i = m + 1, \dots, n$$

- $$17.19 \quad \text{Suppose that the sequence } \{(\mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t)\} \text{ satisfies all the conditions in (17.18) for } q_0 = 1, \text{ and suppose further that } H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}_t) \text{ is concave in } (\mathbf{x}, \mathbf{u}) \text{ for every } t \geq 0. \text{ Then the sequence } \{(\mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t)\} \text{ is optimal.}$$

The Hamiltonian $H = H(t, \mathbf{x}, \mathbf{u}, \mathbf{p})$ associated with (17.1), with $\mathbf{p} = (p^1, \dots, p^n)$.

The maximum principle for (17.1). Necessary conditions for optimality. U is convex. (The Hamiltonian is not necessarily maximized by \mathbf{u}_t^* .)

Terminal conditions for problem (17.1).

The Hamiltonian $H = H(t, \mathbf{x}, \mathbf{u}, \mathbf{p})$ associated with (17.1) with terminal conditions (17.16).

The maximum principle for (17.1) with terminal conditions (17.16).

Necessary conditions for optimality. (a'), (b'), or (c') holds when (a), (b), or (c) in (17.16) holds, respectively. U is convex. (Except in degenerate cases, one can put $q_0 = 1$.)

Sufficient conditions for optimality.

Infinite horizon

$$\begin{aligned}
 17.20 \quad & \max \sum_{t=0}^{\infty} f(t, \mathbf{x}_t, \mathbf{u}_t) \\
 & \mathbf{x}_{t+1} = \mathbf{g}(t, \mathbf{x}_t, \mathbf{u}_t), \quad t = 0, 1, 2, \dots \\
 & \mathbf{x}_0 = \mathbf{x}^0, \quad \mathbf{x}_t \in \mathbb{R}^n, \quad \mathbf{u}_t \in U \subset \mathbb{R}^r, \quad t = 0, 1, 2, \dots
 \end{aligned}$$

It is assumed that the infinite sum converges for every admissible pair.

The sequence $\{(\mathbf{x}_t^*, \mathbf{u}_t^*)\}$ is *catching up optimal* (CU-optimal) if for every admissible sequence $\{(\mathbf{x}_t, \mathbf{u}_t)\}$,

$$17.21 \quad \liminf_{t \rightarrow \infty} D(t) \geq 0$$

where $D(t) = \sum_{\tau=0}^t (f(\tau, \mathbf{x}_\tau^*, \mathbf{u}_\tau^*) - f(\tau, \mathbf{x}_\tau, \mathbf{u}_\tau))$.

Definition of “catching up optimality”. For \liminf see (12.42) and (12.43).

Suppose that the sequence $\{(\mathbf{x}_t^*, \mathbf{u}_t^*, \mathbf{p}_t)\}$ satisfies the conditions (1) and (2) in (17.18) with $q_0 = 1$. Suppose further that the Hamiltonian function $H(t, \mathbf{x}, \mathbf{u}, \mathbf{p}_t)$ is concave in (\mathbf{x}, \mathbf{u}) for every t . Then $\{(\mathbf{x}_t^*, \mathbf{u}_t^*)\}$ is CU-optimal provided that the following limit condition is satisfied: For all admissible sequences $\{(\mathbf{x}_t, \mathbf{u}_t)\}$,

$$17.22 \quad \liminf_{t \rightarrow \infty} \mathbf{p}_t \cdot (\mathbf{x}_t - \mathbf{x}_t^*) \geq 0$$

Sufficient optimality conditions for an infinite horizon problem with no terminal conditions.

References

See Bellman (1957), Stokey, Lucas, and Prescott (1989), and Sydsæter et al. (2005).

Chapter 18

Vectors in \mathbb{R}^n . Abstract spaces

18.1 $\mathbf{a}_1 = \begin{pmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{n1} \end{pmatrix}, \mathbf{a}_2 = \begin{pmatrix} a_{12} \\ a_{22} \\ \vdots \\ a_{n2} \end{pmatrix}, \dots, \mathbf{a}_m = \begin{pmatrix} a_{1m} \\ a_{2m} \\ \vdots \\ a_{nm} \end{pmatrix}$ | m (column) vectors in \mathbb{R}^n .

18.2 If x_1, x_2, \dots, x_m are real numbers, then
 $x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \dots + x_m\mathbf{a}_m$
is a *linear combination* of $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_m$. | Definition of a linear combination of vectors.

The vectors $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_m$ in \mathbb{R}^n are

18.3

- *linearly dependent* if there exist numbers c_1, c_2, \dots, c_m , not all zero, such that
 $c_1\mathbf{a}_1 + c_2\mathbf{a}_2 + \dots + c_m\mathbf{a}_m = \mathbf{0}$
- *linearly independent* if they are not linearly dependent.

 | Definition of linear dependence and independence.

18.4 The vectors $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_m$ in (18.1) are linearly independent if and only if the matrix $(a_{ij})_{n \times m}$ has rank m . | A characterization of linear independence for m vectors in \mathbb{R}^n . (See (19.23) for the definition of rank.)

The vectors $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_n$ in \mathbb{R}^n are linearly independent if and only if

18.5
$$\begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{vmatrix} \neq 0$$
 | A characterization of linear independence for n vectors in \mathbb{R}^n . (A special case of (18.4).)

18.6 A non-empty subset V of vectors in \mathbb{R}^n is a *subspace* of \mathbb{R}^n if $c_1\mathbf{a}_1 + c_2\mathbf{a}_2 \in V$ for all $\mathbf{a}_1, \mathbf{a}_2$ in V and all numbers c_1, c_2 . | Definition of a subspace.

- 18.7 If V is a subset of \mathbb{R}^n , then $\mathcal{S}[V]$ is the set of all linear combinations of vectors from V . $\mathcal{S}[V]$ is called the *span* of V .
- A collection of vectors $\mathbf{a}_1, \dots, \mathbf{a}_m$ in a subspace V of \mathbb{R}^n is a *basis* for V if the following two conditions are satisfied:
- 18.8
- $\mathbf{a}_1, \dots, \mathbf{a}_m$ are linearly independent
 - $\mathcal{S}[\mathbf{a}_1, \dots, \mathbf{a}_m] = V$
- Definition of a basis for a subspace.
- The *dimension* $\dim V$, of a subspace V of \mathbb{R}^n is the number of vectors in a basis for V . (Two bases for V always have the same number of vectors.)
- 18.9
- Definition of the dimension of a subspace. In particular, $\dim \mathbb{R}^n = n$.
- Let V be an m -dimensional subspace of \mathbb{R}^n .
- 18.10
- Any collection of m linearly independent vectors in V is a basis for V .
 - Any collection of m vectors in V that spans V is a basis for V .
- Important facts about subspaces.
- The *inner product* of $\mathbf{a} = (a_1, \dots, a_m)$ and $\mathbf{b} = (b_1, \dots, b_m)$ is the number
- 18.11
- $$\mathbf{a} \cdot \mathbf{b} = a_1 b_1 + \dots + a_m b_m = \sum_{j=1}^m a_j b_j$$
- Definition of the inner product, also called *scalar product* or *dot product*.
- $\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a}$
- 18.12
- $$\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = \mathbf{a} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{c}$$
- $$(\alpha \mathbf{a}) \cdot \mathbf{b} = \mathbf{a} \cdot (\alpha \mathbf{b}) = \alpha(\mathbf{a} \cdot \mathbf{b})$$
- $$\mathbf{a} \cdot \mathbf{a} > 0 \iff \mathbf{a} \neq \mathbf{0}$$
- Properties of the inner product. α is a scalar (i.e. a real number).
- 18.13
- $$\|\mathbf{a}\| = \sqrt{a_1^2 + a_2^2 + \dots + a_n^2} = \sqrt{\mathbf{a} \cdot \mathbf{a}}$$
- Definition of the (*Euclidean*) *norm* (or *length*) of a vector.
- (a) $\|\mathbf{a}\| > 0$ for $\mathbf{a} \neq \mathbf{0}$ and $\|\mathbf{0}\| = 0$
- (b) $\|\alpha \mathbf{a}\| = |\alpha| \|\mathbf{a}\|$
- (c) $\|\mathbf{a} + \mathbf{b}\| \leq \|\mathbf{a}\| + \|\mathbf{b}\|$
- (d) $|\mathbf{a} \cdot \mathbf{b}| \leq \|\mathbf{a}\| \cdot \|\mathbf{b}\|$
- 18.14
- Properties of the norm. $\mathbf{a}, \mathbf{b} \in \mathbb{R}^n$, α is a scalar. (d) is the *Cauchy-Schwarz inequality*. $\|\mathbf{a} - \mathbf{b}\|$ is the *distance* between \mathbf{a} and \mathbf{b} .
- The *angle* φ between two nonzero vectors \mathbf{a} and \mathbf{b} is defined by
- 18.15
- $$\cos \varphi = \frac{\mathbf{a} \cdot \mathbf{b}}{\|\mathbf{a}\| \cdot \|\mathbf{b}\|}, \quad 0 \leq \varphi \leq \pi$$
- Definition of the angle between two vectors in \mathbb{R}^n . The vectors \mathbf{a} and \mathbf{b} are called *orthogonal* if $\mathbf{a} \cdot \mathbf{b} = 0$.

Vector spaces

A *vector space* (or *linear space*) (over \mathbb{R}) is a set V of elements, often called *vectors*, with two operations, “addition” ($V \times V \rightarrow V$) and “scalar multiplication” ($\mathbb{R} \times V \rightarrow V$), that for all x, y, z in V , and all real numbers α and β satisfy the following axioms:

- 18.16
- (a) $(x + y) + z = x + (y + z)$, $x + y = y + x$.
 - (b) There is an element 0 in V with $x + 0 = x$.
 - (c) For every x in V , the element $(-1)x$ in V has the property $x + (-1)x = 0$.
 - (d) $(\alpha + \beta)x = \alpha x + \beta x$, $\alpha(\beta x) = (\alpha\beta)x$,
 $\alpha(x + y) = \alpha x + \alpha y$, $1x = x$.

Definition of a vector space. With obvious modifications, definitions (18.2), (18.3), (18.6), and (18.7), of a linear combination, of linearly dependent and independent sets of vectors, of a subspace, and of the span, carry over to vector spaces.

- 18.17 A set B of vectors in a vector space V is a *basis* for V if the vectors in B are linearly independent, and B spans V , $\mathcal{S}[B] = V$.

Definition of a basis of a vector space.

Metric spaces

A *metric space* is a set M equipped with a *distance function* $d: M \times M \rightarrow \mathbb{R}$, such that the following axioms hold for all x, y, z in M :

- 18.18
- (a) $d(x, y) \geq 0$, and $d(x, y) = 0 \Leftrightarrow x = y$
 - (b) $d(x, y) = d(y, x)$
 - (c) $d(x, y) \leq d(x, z) + d(z, y)$

Definition of a metric space. The distance function d is also called a *metric* on M . (c) is called the *triangle inequality*.

A sequence $\{x_n\}$ in a metric space is

- 18.19
- *convergent* with limit x , and we write $\lim_{n \rightarrow \infty} x_n = x$ (or $x_n \rightarrow x$ as $n \rightarrow \infty$), if $d(x_n, x) \rightarrow 0$ as $n \rightarrow \infty$;
 - a *Cauchy sequence* if for every $\varepsilon > 0$ there exists an integer N such that $d(x_n, x_m) < \varepsilon$ for all $m, n \geq N$.

Important definitions. A sequence that is not convergent is called *divergent*.

- 18.20 A subset S of a metric space M is *dense* in M if each point in M is the limit of a sequence of points in S .

Definition of a dense subset.

A metric space M is

- 18.21
- *complete* if every Cauchy sequence in M is convergent;
 - *separable* if there exists a countable subset S of M that is dense in M .

Definition of complete and separable metric spaces.

Normed vector spaces. Banach spaces

A *normed vector space* (over \mathbb{R}) is a vector space V , together with a function $\|\cdot\| : V \rightarrow \mathbb{R}$, such that for all x, y in V and all real numbers α ,

- 18.22
- (a) $\|x\| > 0$ for $x \neq 0$ and $\|0\| = 0$
 - (b) $\|\alpha x\| = |\alpha| \|x\|$
 - (c) $\|x + y\| \leq \|x\| + \|y\|$

- $l^p(n)$: \mathbb{R}^n , with $\|\mathbf{x}\| = \left(\sum_{i=1}^n |x_i|^p\right)^{1/p}$ ($p \geq 1$)
(For $p = 2$ this is the Euclidean norm.)

- $l^\infty(n)$: \mathbb{R}^n , with $\|\mathbf{x}\| = \max(|x_1|, \dots, |x_n|)$
- l^p ($p \geq 1$): the set of all infinite sequences $\mathbf{x} = (x_0, x_1, \dots)$ of real numbers such that

$$\sum_{i=1}^{\infty} |x_i|^p \text{ converges. } \|\mathbf{x}\| = \left(\sum_{i=1}^{\infty} |x_i|^p\right)^{1/p}.$$

18.23 For $\mathbf{x} = (x_0, x_1, \dots)$ and $\mathbf{y} = (y_0, y_1, \dots)$ in l^p , by definition, $\mathbf{x} + \mathbf{y} = (x_0 + y_0, x_1 + y_1, \dots)$ and $\alpha \mathbf{x} = (\alpha x_0, \alpha x_1, \dots)$.

- l^∞ : the set of all *bounded* infinite sequences $\mathbf{x} = (x_0, x_1, \dots)$ of real numbers, with $\|\mathbf{x}\| = \sup_i |x_i|$. (Vector operations defined as for l^p .)

- $C(X)$: the set of all bounded, continuous functions $f : X \rightarrow \mathbb{R}$, where X is a metric space, and with $\|f\| = \sup_{x \in X} |f(x)|$. If f and g are in $C(X)$ and $\alpha \in \mathbb{R}$, then $f + g$ and αf are defined by $(f + g)(x) = f(x) + g(x)$ and $(\alpha f)(x) = \alpha f(x)$.

Let X be compact metric space, and let F be a subset of the Banach space $C(X)$ (see (18.23)) that is

- 18.24
- *uniformly bounded*, i.e. there exists a number M such that $|f(x)| \leq M$ for all f in F and all x in X ,
 - *equicontinuous*, i.e. for each $\varepsilon > 0$ there exists a $\delta > 0$ such that if $\|x - x'\| < \delta$, then $|f(x) - f(x')| < \varepsilon$ for all f in F .

Then the closure of F is compact.

With the distance function $d(x, y) = \|x - y\|$, V becomes a metric space. If this metric space is complete, then V is called a *Banach space*.

Some standard examples of normed vector spaces, that are also Banach spaces.

Ascoli's theorem. (Together with Schauder's theorem (18.25), this result is useful e.g. in economic dynamics. See Stokey, Lucas, and Prescott (1989).)

- 18.25 If K is a compact, convex set in a Banach space X , then any continuous function f of K into itself has a fixed point, i.e. there exists a point x^* in K such that $f(x^*) = x^*$.

Schauder's fixed point theorem.

- 18.26 Let $T : X \rightarrow X$ be a mapping of a complete metric space X into itself, and suppose there exists a number k in $[0, 1)$ such that

$$(*) \quad d(Tx, Ty) \leq kd(x, y) \quad \text{for all } x, y \text{ in } X$$

Then:

- (a) T has a fixed point x^* , i.e. $T(x^*) = x^*$.
 (b) $d(T^n x^0, x^*) \leq k^n d(x^0, x^*)$ for all x^0 in X and all $n = 0, 1, 2, \dots$

The existence of a fixed point for a contraction mapping. k is called a *modulus* of the contraction mapping. (See also (6.23) and (6.25).) A mapping that satisfies (*) for some k in $[0, 1)$, is called a *contraction mapping*.

Let $C(X)$ be the Banach space defined in (18.23) and let T be a mapping of $C(X)$ into $C(X)$ satisfying:

- 18.27 (a) (Monotonicity) If $f, g \in C(X)$ and $f(x) \leq g(x)$ for all x in X , then $(Tf)(x) \leq (Tg)(x)$ for all $x \in X$.
 (b) (Discounting) There exists some α in $(0, 1)$ such that for all f in $C(X)$, all $a \geq 0$, and all x in X ,
- $$[T(f + a)](x) \leq (Tf)(x) + \alpha a$$

Then T is a contraction mapping with modulus α .

Blackwell's sufficient conditions for a contraction. Here $(f + a)(x)$ is defined as $f(x) + a$.

Inner product spaces. Hilbert spaces

- 18.28 An *inner product space* (over \mathbb{R}) is a vector space V , together with a function that to each ordered pair of vectors (x, y) in V associates a real number, $\langle x, y \rangle$, such that for all x, y, z in V and all real numbers α ,

- (a) $\langle x, y \rangle = \langle y, x \rangle$
 (b) $\langle x, y + z \rangle = \langle x, y \rangle + \langle x, z \rangle$
 (c) $\alpha \langle x, y \rangle = \langle \alpha x, y \rangle = \langle x, \alpha y \rangle$
 (d) $\langle x, x \rangle \geq 0$ and $\langle x, x \rangle = 0 \Leftrightarrow x = 0$

Definition of an inner product space. If we define $\|x\| = \sqrt{\langle x, x \rangle}$, then V becomes a normed vector space. If this space is complete, V is called a *Hilbert space*.

- | | | |
|-------|--|--|
| 18.29 | <ul style="list-style-type: none"> • $l^2(n)$, with $\langle \mathbf{x}, \mathbf{y} \rangle = \sum_{i=1}^n x_i y_i$ • l^2, with $\langle \mathbf{x}, \mathbf{y} \rangle = \sum_{i=1}^{\infty} x_i y_i$ | <p>Examples of Hilbert spaces.</p> |

References

All the results on vectors in \mathbb{R}^n are standard and can be found in any linear algebra text, e.g. Fraleigh and Bearegard (1995) or Lang (1987). For abstract spaces, see Kolmogorov and Fomin (1975), or Royden (1968). For contraction mappings and their application in economic dynamics, see Stokey, Lucas, and Prescott (1989).

Chapter 19

Matrices

$$19.1 \quad \mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix} = (a_{ij})_{m \times n}$$

Notation for a *matrix*, where a_{ij} is the element in the i th row and the j th column. The matrix has *order* $m \times n$. If $m = n$, the matrix is *square* of order n .

$$19.2 \quad \mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ 0 & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & a_{nn} \end{pmatrix}$$

An *upper triangular matrix*. (All elements below the diagonal are 0.) The transpose of \mathbf{A} (see (19.11)) is called *lower triangular*.

$$19.3 \quad \text{diag}(a_1, a_2, \dots, a_n) = \begin{pmatrix} a_1 & 0 & \cdots & 0 \\ 0 & a_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & a_n \end{pmatrix}$$

A *diagonal matrix*.

$$19.4 \quad \begin{pmatrix} a & 0 & \cdots & 0 \\ 0 & a & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & a \end{pmatrix}_{n \times n}$$

A *scalar matrix*.

$$19.5 \quad \mathbf{I}_n = \begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 1 \end{pmatrix}_{n \times n}$$

The *unit* or *identity matrix*.

If $\mathbf{A} = (a_{ij})_{m \times n}$, $\mathbf{B} = (b_{ij})_{m \times n}$, and α is a scalar, we define

$$19.6 \quad \begin{aligned} \mathbf{A} + \mathbf{B} &= (a_{ij} + b_{ij})_{m \times n} \\ \alpha \mathbf{A} &= (\alpha a_{ij})_{m \times n} \\ \mathbf{A} - \mathbf{B} &= \mathbf{A} + (-1)\mathbf{B} = (a_{ij} - b_{ij})_{m \times n} \end{aligned}$$

Matrix operations. (The scalars are real or complex numbers.)

$$(\mathbf{A} + \mathbf{B}) + \mathbf{C} = \mathbf{A} + (\mathbf{B} + \mathbf{C})$$

$$\mathbf{A} + \mathbf{B} = \mathbf{B} + \mathbf{A}$$

$$\mathbf{A} + \mathbf{0} = \mathbf{A}$$

19.7

$$\mathbf{A} + (-\mathbf{A}) = \mathbf{0}$$

$$(a + b)\mathbf{A} = a\mathbf{A} + b\mathbf{A}$$

$$a(\mathbf{A} + \mathbf{B}) = a\mathbf{A} + a\mathbf{B}$$

Properties of matrix operations. $\mathbf{0}$ is the zero (or null) matrix, all of whose elements are zero. a and b are scalars.

If $\mathbf{A} = (a_{ij})_{m \times n}$ and $\mathbf{B} = (b_{jk})_{n \times p}$, we define the *product* $\mathbf{C} = \mathbf{AB}$ as the $m \times p$ matrix $\mathbf{C} = (c_{ik})_{m \times p}$ where

19.8

$$c_{ik} = a_{i1}b_{1k} + \cdots + a_{ij}b_{jk} + \cdots + a_{in}b_{nk}$$

The definition of *matrix multiplication*.

$$\begin{pmatrix} a_{11} & \cdots & a_{1j} & \cdots & a_{1n} \\ \vdots & & \vdots & & \vdots \\ \boxed{a_{i1}} & \cdots & \boxed{a_{ij}} & \cdots & \boxed{a_{in}} \\ \vdots & & \vdots & & \vdots \\ a_{m1} & \cdots & a_{mj} & \cdots & a_{mn} \end{pmatrix} \cdot \begin{pmatrix} b_{11} & \cdots & \boxed{b_{1k}} & \cdots & b_{1p} \\ \vdots & & \vdots & & \vdots \\ b_{j1} & \cdots & \boxed{b_{jk}} & \cdots & b_{jp} \\ \vdots & & \vdots & & \vdots \\ b_{n1} & \cdots & \boxed{b_{nk}} & \cdots & b_{np} \end{pmatrix} = \begin{pmatrix} c_{11} & \cdots & c_{1k} & \cdots & c_{1p} \\ \vdots & & \vdots & & \vdots \\ c_{i1} & \cdots & \boxed{c_{ik}} & \cdots & c_{ip} \\ \vdots & & \vdots & & \vdots \\ c_{m1} & \cdots & c_{mk} & \cdots & c_{mp} \end{pmatrix}$$

$$(\mathbf{AB})\mathbf{C} = \mathbf{A}(\mathbf{BC})$$

19.9

$$\mathbf{A}(\mathbf{B} + \mathbf{C}) = \mathbf{AB} + \mathbf{AC}$$

$$(\mathbf{A} + \mathbf{B})\mathbf{C} = \mathbf{AC} + \mathbf{BC}$$

Properties of matrix multiplication.

$$\mathbf{AB} \neq \mathbf{BA}$$

19.10

$$\mathbf{AB} = \mathbf{0} \not\Rightarrow \mathbf{A} = \mathbf{0} \text{ or } \mathbf{B} = \mathbf{0}$$

$$\mathbf{AB} = \mathbf{AC} \ \& \ \mathbf{A} \neq \mathbf{0} \not\Rightarrow \mathbf{B} = \mathbf{C}$$

Important observations about matrix multiplication. $\mathbf{0}$ is the zero matrix. $\not\Rightarrow$ should be read: “does not necessarily imply”.

$$19.11 \quad \mathbf{A}' = \begin{pmatrix} a_{11} & a_{21} & \cdots & a_{m1} \\ a_{12} & a_{22} & \cdots & a_{m2} \\ \vdots & \vdots & & \vdots \\ a_{1n} & a_{2n} & \cdots & a_{mn} \end{pmatrix}$$

\mathbf{A}' , the *transpose* of $\mathbf{A} = (a_{ij})_{m \times n}$, is the $n \times m$ matrix obtained by interchanging rows and columns in \mathbf{A} .

$$(\mathbf{A}')' = \mathbf{A}$$

19.12

$$(\mathbf{A} + \mathbf{B})' = \mathbf{A}' + \mathbf{B}'$$

$$(\alpha\mathbf{A})' = \alpha\mathbf{A}'$$

$$(\mathbf{AB})' = \mathbf{B}'\mathbf{A}' \quad (\text{NOTE the order!})$$

Rules for transposes.

19.13

$$\mathbf{B} = \mathbf{A}^{-1} \iff \mathbf{AB} = \mathbf{I}_n \iff \mathbf{BA} = \mathbf{I}_n$$

The *inverse* of an $n \times n$ matrix \mathbf{A} . \mathbf{I}_n is the identity matrix.

$$19.14 \quad \mathbf{A}^{-1} \text{ exists} \iff |\mathbf{A}| \neq 0$$

A necessary and sufficient condition for a matrix to have an inverse, i.e. to be *invertible*. $|\mathbf{A}|$ denotes the determinant of the square matrix \mathbf{A} . (See Chapter 20.)

$$19.15 \quad \mathbf{A} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \implies \mathbf{A}^{-1} = \frac{1}{ad - bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

Valid if $|\mathbf{A}| = ad - bc \neq 0$.

If $\mathbf{A} = (a_{ij})_{n \times n}$ is a square matrix and $|\mathbf{A}| \neq 0$, the unique inverse of \mathbf{A} is given by

$$\mathbf{A}^{-1} = \frac{1}{|\mathbf{A}|} \text{adj}(\mathbf{A}), \quad \text{where}$$

$$\text{adj}(\mathbf{A}) = \begin{pmatrix} A_{11} & A_{21} & \cdots & A_{n1} \\ A_{12} & A_{22} & \cdots & A_{n2} \\ \vdots & \vdots & \ddots & \vdots \\ A_{1n} & A_{2n} & \cdots & A_{nn} \end{pmatrix}$$

19.16

Here the *cofactor*, A_{ij} , of the element a_{ij} is given by

$$A_{ij} = (-1)^{i+j} \begin{vmatrix} a_{11} & \cdots & a_{1j} & \cdots & a_{1n} \\ \vdots & & \vdots & & \vdots \\ a_{i1} & \cdots & \boxed{a_{ij}} & \cdots & a_{in} \\ \vdots & & \vdots & & \vdots \\ a_{n1} & \cdots & a_{nj} & \cdots & a_{nn} \end{vmatrix}$$

The general formula for the inverse of a square matrix. NOTE the order of the indices in the *adjoint matrix*, $\text{adj}(\mathbf{A})$. The matrix $(A_{ij})_{n \times n}$ is called the *cofactor matrix*, and thus the adjoint is the transpose of the cofactor matrix. In the formula for the cofactor, A_{ij} , the determinant is obtained by deleting the i th row and the j th column in $|\mathbf{A}|$.

$$19.17 \quad \begin{aligned} (\mathbf{A}^{-1})^{-1} &= \mathbf{A} \\ (\mathbf{AB})^{-1} &= \mathbf{B}^{-1} \mathbf{A}^{-1} \quad (\text{NOTE the order!}) \\ (\mathbf{A}')^{-1} &= (\mathbf{A}^{-1})' \\ (c\mathbf{A})^{-1} &= c^{-1} \mathbf{A}^{-1} \end{aligned}$$

Properties of the inverse. (\mathbf{A} and \mathbf{B} are invertible $n \times n$ matrices. c is a scalar $\neq 0$.)

$$19.18 \quad (\mathbf{I}_m + \mathbf{AB})^{-1} = \mathbf{I}_m - \mathbf{A}(\mathbf{I}_n + \mathbf{BA})^{-1} \mathbf{B}$$

\mathbf{A} is $m \times n$, \mathbf{B} is $n \times m$, $|\mathbf{I}_m + \mathbf{AB}| \neq 0$.

$$19.19 \quad \mathbf{R}^{-1} \mathbf{A}' (\mathbf{AR}^{-1} \mathbf{A}' + \mathbf{Q}^{-1})^{-1} = (\mathbf{A}' \mathbf{QA} + \mathbf{R})^{-1} \mathbf{A}' \mathbf{Q}$$

Matrix inversion pairs. Valid if the inverses exist.

A square matrix \mathbf{A} of order n is called

- 19.20
- *symmetric* if $\mathbf{A} = \mathbf{A}'$
 - *skew-symmetric* if $\mathbf{A} = -\mathbf{A}'$
 - *idempotent* if $\mathbf{A}^2 = \mathbf{A}$
 - *involutive* if $\mathbf{A}^2 = \mathbf{I}_n$
 - *orthogonal* if $\mathbf{A}'\mathbf{A} = \mathbf{I}_n$
 - *singular* if $|\mathbf{A}| = 0$, *nonsingular* if $|\mathbf{A}| \neq 0$

Some important definitions. $|\mathbf{A}|$ denotes the determinant of the square matrix \mathbf{A} . (See Chapter 20.) For properties of idempotent and orthogonal matrices, see Chapter 22.

19.21
$$\text{tr}(\mathbf{A}) = \sum_{i=1}^n a_{ii}$$

The *trace* of $\mathbf{A} = (a_{ij})_{n \times n}$ is the sum of its diagonal elements.

19.22

$$\text{tr}(\mathbf{A} + \mathbf{B}) = \text{tr}(\mathbf{A}) + \text{tr}(\mathbf{B})$$

$$\text{tr}(c\mathbf{A}) = c \text{tr}(\mathbf{A}) \quad (c \text{ is a scalar})$$

$$\text{tr}(\mathbf{AB}) = \text{tr}(\mathbf{BA}) \quad (\text{if } \mathbf{AB} \text{ is a square matrix})$$

$$\text{tr}(\mathbf{A}') = \text{tr}(\mathbf{A})$$

Properties of the trace.

19.23 $r(\mathbf{A}) =$ maximum number of linearly independent rows in $\mathbf{A} =$ maximum number of linearly independent columns in $\mathbf{A} =$ order of the largest nonzero minor of \mathbf{A} .

Equivalent definitions of the *rank* of a matrix. On minors, see (20.15).

- 19.24
- (1) $r(\mathbf{A}) = r(\mathbf{A}') = r(\mathbf{A}'\mathbf{A}) = r(\mathbf{A}\mathbf{A}')$
 - (2) $r(\mathbf{AB}) \leq \min(r(\mathbf{A}), r(\mathbf{B}))$
 - (3) $r(\mathbf{AB}) = r(\mathbf{B})$ if $|\mathbf{A}| \neq 0$
 - (4) $r(\mathbf{CA}) = r(\mathbf{C})$ if $|\mathbf{A}| \neq 0$
 - (5) $r(\mathbf{PAQ}) = r(\mathbf{A})$ if $|\mathbf{P}| \neq 0, |\mathbf{Q}| \neq 0$
 - (6) $|r(\mathbf{A}) - r(\mathbf{B})| \leq r(\mathbf{A} + \mathbf{B}) \leq r(\mathbf{A}) + r(\mathbf{B})$
 - (7) $r(\mathbf{AB}) \geq r(\mathbf{A}) + r(\mathbf{B}) - n$
 - (8) $r(\mathbf{AB}) + r(\mathbf{BC}) \leq r(\mathbf{B}) + r(\mathbf{ABC})$

Properties of the rank. The orders of the matrices are such that the required operations are defined. In result (7), *Sylvester's inequality*, \mathbf{A} is $m \times n$ and \mathbf{B} is $n \times p$. (8) is called *Frobenius's inequality*.

19.25 $\mathbf{Ax} = \mathbf{0}$ for some $\mathbf{x} \neq \mathbf{0} \iff r(\mathbf{A}) \leq n - 1$

A useful result on homogeneous equations. \mathbf{A} is $m \times n$, \mathbf{x} is $n \times 1$.

A matrix norm is a function $\|\cdot\|_\beta$ that to each square matrix \mathbf{A} associates a real number $\|\mathbf{A}\|_\beta$ such that:

- 19.26
- $\|\mathbf{A}\|_\beta > 0$ for $\mathbf{A} \neq \mathbf{0}$ and $\|\mathbf{0}\|_\beta = 0$
 - $\|c\mathbf{A}\|_\beta = |c| \|\mathbf{A}\|_\beta$ (c is a scalar)
 - $\|\mathbf{A} + \mathbf{B}\|_\beta \leq \|\mathbf{A}\|_\beta + \|\mathbf{B}\|_\beta$
 - $\|\mathbf{AB}\|_\beta \leq \|\mathbf{A}\|_\beta \|\mathbf{B}\|_\beta$

Definition of a *matrix norm*. (There are an infinite number of such norms, some of which are given in (19.27).)

- $\|\mathbf{A}\|_1 = \max_{j=1,\dots,n} \sum_{i=1}^n |a_{ij}|$
 • $\|\mathbf{A}\|_\infty = \max_{i=1,\dots,n} \sum_{j=1}^n |a_{ij}|$
- 19.27 • $\|\mathbf{A}\|_2 = \sqrt{\lambda}$, where λ is the largest eigenvalue of $\mathbf{A}'\mathbf{A}$.
- $\|\mathbf{A}\|_M = n \max_{i,j=1,\dots,n} |a_{ij}|$
- $\|\mathbf{A}\|_T = \left(\sum_{j=1}^n \sum_{i=1}^n |a_{ij}|^2 \right)^{1/2}$
- 19.28 λ eigenvalue of $\mathbf{A} = (a_{ij})_{n \times n} \Rightarrow |\lambda| \leq \|\mathbf{A}\|_\beta$
- 19.29 $\|\mathbf{A}\|_\beta < 1 \Rightarrow \mathbf{A}^t \rightarrow \mathbf{0}$ as $t \rightarrow \infty$
- 19.30 $e^{\mathbf{A}} = \sum_{n=0}^{\infty} \frac{1}{n!} \mathbf{A}^n$
- 19.31 $e^{\mathbf{A}+\mathbf{B}} = e^{\mathbf{A}}e^{\mathbf{B}}$ if $\mathbf{A}\mathbf{B} = \mathbf{B}\mathbf{A}$
- $(e^{\mathbf{A}})^{-1} = e^{-\mathbf{A}}, \quad \frac{d}{dx}(e^{x\mathbf{A}}) = \mathbf{A}e^{x\mathbf{A}}$
- Some matrix norms for $\mathbf{A} = (a_{ij})_{n \times n}$. (For eigenvalues, see Chapter 21.)
- The modulus of any eigenvalue of \mathbf{A} is less than or equal to any matrix norm of \mathbf{A} .
- Sufficient condition for $\mathbf{A}^t \rightarrow \mathbf{0}$ as $t \rightarrow \infty$. $\|\mathbf{A}\|_\beta$ is any matrix norm of \mathbf{A} .
- The *exponential matrix* of a square matrix \mathbf{A} .
- Properties of the exponential matrix.

Linear transformations

- A function $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ is called a *linear transformation* (or function) if
- 19.32 (1) $T(\mathbf{x} + \mathbf{y}) = T(\mathbf{x}) + T(\mathbf{y})$
 (2) $T(c\mathbf{x}) = cT(\mathbf{x})$
 for all \mathbf{x} and \mathbf{y} in \mathbb{R}^n and for all scalars c .
- If \mathbf{A} is an $m \times n$ matrix, the function $T_{\mathbf{A}} : \mathbb{R}^n \rightarrow \mathbb{R}^m$ defined by $T_{\mathbf{A}}(\mathbf{x}) = \mathbf{A}\mathbf{x}$ is a linear transformation.
- 19.33
- Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear transformation and let \mathbf{A} be the $m \times n$ matrix whose j th column is $T(\mathbf{e}_j)$, where \mathbf{e}_j is the j th standard unit vector in \mathbb{R}^n . Then $T(\mathbf{x}) = \mathbf{A}\mathbf{x}$ for all \mathbf{x} in \mathbb{R}^n .
- 19.34
- Definition of a linear transformation.
- An important fact.
- The matrix \mathbf{A} is called the *standard matrix representation* of T .

19.35	Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ and $S : \mathbb{R}^m \rightarrow \mathbb{R}^k$ be two linear transformations with standard matrix representations \mathbf{A} and \mathbf{B} , respectively. Then the composition $S \circ T$ of the two transformations is a linear transformation with standard matrix representation \mathbf{BA} .	A basic fact.
19.36	Let \mathbf{A} be an invertible $n \times n$ matrix with associated linear transformation T . The transformation T^{-1} associated with \mathbf{A}^{-1} is the inverse transformation (function) of T .	A basic fact.
Generalized inverses		
19.37	An $n \times m$ matrix \mathbf{A}^- is called a <i>generalized inverse</i> of the $m \times n$ matrix \mathbf{A} if $\mathbf{AA}^- \mathbf{A} = \mathbf{A}$	Definition of a generalized inverse of a matrix. (\mathbf{A}^- is not unique in general.)
19.38	A necessary and sufficient condition for the matrix equation $\mathbf{Ax} = \mathbf{b}$ to have a solution is that $\mathbf{AA}^- \mathbf{b} = \mathbf{b}$. The general solution is then $\mathbf{x} = \mathbf{A}^- \mathbf{b} + (\mathbf{I} - \mathbf{A}^- \mathbf{A}) \mathbf{q}$, where \mathbf{q} is an arbitrary vector of appropriate order.	An important application of generalized inverses.
19.39	If \mathbf{A}^- is a generalized inverse of \mathbf{A} , then <ul style="list-style-type: none"> • \mathbf{AA}^- and $\mathbf{A}^- \mathbf{A}$ are idempotent • $r(\mathbf{A}) = r(\mathbf{A}^- \mathbf{A}) = \text{tr}(\mathbf{A}^- \mathbf{A})$ • $(\mathbf{A}^-)'$ is a generalized inverse of \mathbf{A}' • \mathbf{A} is square and nonsingular $\Rightarrow \mathbf{A}^- = \mathbf{A}^{-1}$ 	Properties of generalized inverses.
19.40	An $n \times m$ matrix \mathbf{A}^+ is called the <i>Moore–Penrose inverse</i> of a real $m \times n$ matrix \mathbf{A} if it satisfies the following four conditions: <ul style="list-style-type: none"> (i) $\mathbf{AA}^+ \mathbf{A} = \mathbf{A}$ (ii) $\mathbf{A}^+ \mathbf{AA}^+ = \mathbf{A}^+$ (iii) $(\mathbf{AA}^+)' = \mathbf{AA}^+$ (iv) $(\mathbf{A}^+ \mathbf{A})' = \mathbf{A}^+ \mathbf{A}$ 	Definition of the Moore–Penrose inverse. (\mathbf{A}^+ exists and is unique.)
19.41	A necessary and sufficient condition for the matrix equation $\mathbf{Ax} = \mathbf{b}$ to have a solution is that $\mathbf{AA}^+ \mathbf{b} = \mathbf{b}$. The general solution is then $\mathbf{x} = \mathbf{A}^+ \mathbf{b} + (\mathbf{I} - \mathbf{A}^+ \mathbf{A}) \mathbf{q}$, where \mathbf{q} is an arbitrary vector of appropriate order.	An important application of the Moore–Penrose inverse.

- \mathbf{A} is square and nonsingular $\Rightarrow \mathbf{A}^+ = \mathbf{A}^{-1}$
 - $(\mathbf{A}^+)^+ = \mathbf{A}$, $(\mathbf{A}')^+ = (\mathbf{A}^+)'$
 - $\mathbf{A}^+ = \mathbf{A}$ if \mathbf{A} is symmetric and idempotent.
 - $\mathbf{A}^+\mathbf{A}$ and $\mathbf{A}\mathbf{A}^+$ are idempotent.
- 19.42
- \mathbf{A} , \mathbf{A}^+ , $\mathbf{A}\mathbf{A}^+$, and $\mathbf{A}^+\mathbf{A}$ have the same rank.
 - $\mathbf{A}'\mathbf{A}\mathbf{A}^+ = \mathbf{A}' = \mathbf{A}^+\mathbf{A}\mathbf{A}'$
 - $(\mathbf{A}\mathbf{A}^+)^+ = \mathbf{A}\mathbf{A}^+$
 - $(\mathbf{A}'\mathbf{A})^+ = \mathbf{A}^+(\mathbf{A}^+)', (\mathbf{A}\mathbf{A}')^+ = (\mathbf{A}^+)' \mathbf{A}^+$
 - $(\mathbf{A} \otimes \mathbf{B})^+ = \mathbf{A}^+ \otimes \mathbf{B}^+$

Properties of the Moore–Penrose inverse. (\otimes is the Kronecker product. See Chapter 23.)

Partitioned matrices

19.43
$$\mathbf{P} = \begin{pmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{P}_{21} & \mathbf{P}_{22} \end{pmatrix}$$

A *partitioned* matrix of order $(p+q) \times (r+s)$. (\mathbf{P}_{11} is $p \times r$, \mathbf{P}_{12} is $p \times s$, \mathbf{P}_{21} is $q \times r$, \mathbf{P}_{22} is $q \times s$.)

19.44
$$\begin{pmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{P}_{21} & \mathbf{P}_{22} \end{pmatrix} \begin{pmatrix} \mathbf{Q}_{11} & \mathbf{Q}_{12} \\ \mathbf{Q}_{21} & \mathbf{Q}_{22} \end{pmatrix} \\ = \begin{pmatrix} \mathbf{P}_{11}\mathbf{Q}_{11} + \mathbf{P}_{12}\mathbf{Q}_{21} & \mathbf{P}_{11}\mathbf{Q}_{12} + \mathbf{P}_{12}\mathbf{Q}_{22} \\ \mathbf{P}_{21}\mathbf{Q}_{11} + \mathbf{P}_{22}\mathbf{Q}_{21} & \mathbf{P}_{21}\mathbf{Q}_{12} + \mathbf{P}_{22}\mathbf{Q}_{22} \end{pmatrix}$$

Multiplication of partitioned matrices. (We assume that the multiplications involved are defined.)

19.45
$$\begin{vmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{P}_{21} & \mathbf{P}_{22} \end{vmatrix} = |\mathbf{P}_{11}| \cdot |\mathbf{P}_{22} - \mathbf{P}_{21}\mathbf{P}_{11}^{-1}\mathbf{P}_{12}|$$

The determinant of a partitioned $n \times n$ matrix, assuming \mathbf{P}_{11}^{-1} exists.

19.46
$$\begin{vmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{P}_{21} & \mathbf{P}_{22} \end{vmatrix} = |\mathbf{P}_{22}| \cdot |\mathbf{P}_{11} - \mathbf{P}_{12}\mathbf{P}_{22}^{-1}\mathbf{P}_{21}|$$

The determinant of a partitioned $n \times n$ matrix, assuming \mathbf{P}_{22}^{-1} exists.

19.47
$$\begin{vmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{0} & \mathbf{P}_{22} \end{vmatrix} = |\mathbf{P}_{11}| \cdot |\mathbf{P}_{22}|$$

A special case.

19.48
$$\begin{pmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{P}_{21} & \mathbf{P}_{22} \end{pmatrix}^{-1} = \\ \begin{pmatrix} \mathbf{P}_{11}^{-1} + \mathbf{P}_{11}^{-1}\mathbf{P}_{12}\mathbf{\Delta}^{-1}\mathbf{P}_{21}\mathbf{P}_{11}^{-1} & -\mathbf{P}_{11}^{-1}\mathbf{P}_{12}\mathbf{\Delta}^{-1} \\ -\mathbf{\Delta}^{-1}\mathbf{P}_{21}\mathbf{P}_{11}^{-1} & \mathbf{\Delta}^{-1} \end{pmatrix}$$

The inverse of a partitioned matrix, assuming \mathbf{P}_{11}^{-1} exists.

where $\mathbf{\Delta} = \mathbf{P}_{22} - \mathbf{P}_{21}\mathbf{P}_{11}^{-1}\mathbf{P}_{12}$.

$$19.49 \quad \begin{pmatrix} \mathbf{P}_{11} & \mathbf{P}_{12} \\ \mathbf{P}_{21} & \mathbf{P}_{22} \end{pmatrix}^{-1} = \begin{pmatrix} \Delta_1^{-1} & -\Delta_1^{-1}\mathbf{P}_{12}\mathbf{P}_{22}^{-1} \\ -\mathbf{P}_{22}^{-1}\mathbf{P}_{21}\Delta_1^{-1} & \mathbf{P}_{22}^{-1} + \mathbf{P}_{22}^{-1}\mathbf{P}_{21}\Delta_1^{-1}\mathbf{P}_{12}\mathbf{P}_{22}^{-1} \end{pmatrix}$$

where $\Delta_1 = \mathbf{P}_{11} - \mathbf{P}_{12}\mathbf{P}_{22}^{-1}\mathbf{P}_{21}$.

The inverse of a partitioned matrix, assuming \mathbf{P}_{22}^{-1} exists.

Matrices with complex elements

Let $\mathbf{A} = (a_{ij})$ be a complex matrix (i.e. the elements of \mathbf{A} are complex numbers). Then:

- 19.50
- $\bar{\mathbf{A}} = (\bar{a}_{ij})$ is called the *conjugate* of \mathbf{A} . (\bar{a}_{ij} denotes the complex conjugate of a_{ij} .)
 - $\mathbf{A}^* = \bar{\mathbf{A}}' = (\bar{a}_{ji})$ is called the *conjugate transpose* of \mathbf{A} .
 - \mathbf{A} is called *Hermitian* if $\mathbf{A} = \mathbf{A}^*$.
 - \mathbf{A} is called *unitary* if $\mathbf{A}^* = \mathbf{A}^{-1}$.

Useful definitions in connection with complex matrices.

- 19.51
- \mathbf{A} is real $\iff \mathbf{A} = \bar{\mathbf{A}}$.
 - If \mathbf{A} is real, then

$$\mathbf{A} \text{ is Hermitian } \iff \mathbf{A} \text{ is symmetric.}$$

Easy consequences of the definitions.

Let \mathbf{A} and \mathbf{B} be complex matrices and c a complex number. Then

- 19.52
- (1) $(\mathbf{A}^*)^* = \mathbf{A}$
 - (2) $(\mathbf{A} + \mathbf{B})^* = \mathbf{A}^* + \mathbf{B}^*$
 - (3) $(c\mathbf{A})^* = \bar{c}\mathbf{A}^*$
 - (4) $(\mathbf{AB})^* = \mathbf{B}^*\mathbf{A}^*$

Properties of the conjugate transpose. (2) and (4) are valid if the sum and the product of the matrices are defined.

References

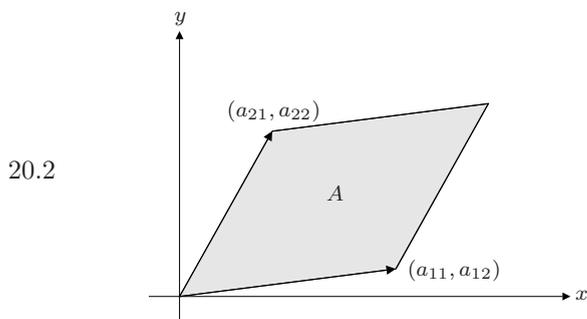

Most of the formulas are standard and can be found in almost any linear algebra text, e.g. Fraleigh and Bearegard (1995) or Lang (1987). See also Sydsæter and Hammond (2005) and Sydsæter et al. (2005). For (19.26)–(19.29), see e.g. Faddeeva (1959). For generalized inverses, see Magnus and Neudecker (1988). A standard reference is Gantmacher (1959).

Chapter 20

Determinants

$$20.1 \quad \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{21}a_{12}$$

Definition of a 2×2 determinant.

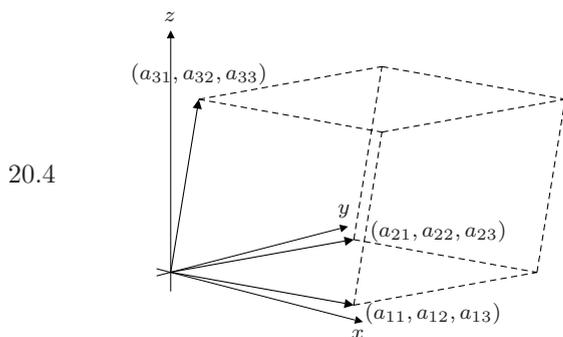

Geometric interpretation of a 2×2 determinant. The area A is the absolute value of the determinant

$$\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix}.$$

$$20.3 \quad \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{cases} a_{11}a_{22}a_{33} - a_{11}a_{23}a_{32} \\ + a_{12}a_{23}a_{31} - a_{12}a_{21}a_{33} \\ + a_{13}a_{21}a_{32} - a_{13}a_{22}a_{31} \end{cases}$$

Definition of a 3×3 determinant.

Geometric interpretation of a 3×3 determinant. The volume of the “box” spanned by the three vectors is the absolute value of the determinant

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}.$$

If $\mathbf{A} = (a_{ij})_{n \times n}$ is an $n \times n$ matrix, the *determinant* of \mathbf{A} is the number

$$|\mathbf{A}| = a_{i1}A_{i1} + \cdots + a_{in}A_{in} = \sum_{j=1}^n a_{ij}A_{ij}$$

where A_{ij} , the cofactor of the element a_{ij} , is

20.5

$$A_{ij} = (-1)^{i+j} \begin{vmatrix} a_{11} & \cdots & a_{1j} & \cdots & a_{1n} \\ \vdots & & \vdots & & \vdots \\ a_{i1} & \cdots & \boxed{a_{ij}} & \cdots & a_{in} \\ \vdots & & \vdots & & \vdots \\ a_{n1} & \cdots & a_{nj} & \cdots & a_{nn} \end{vmatrix}$$

$$a_{i1}A_{i1} + a_{i2}A_{i2} + \cdots + a_{in}A_{in} = |\mathbf{A}|$$

$$a_{i1}A_{k1} + a_{i2}A_{k2} + \cdots + a_{in}A_{kn} = 0 \quad \text{if } k \neq i$$

20.6

$$a_{1j}A_{1j} + a_{2j}A_{2j} + \cdots + a_{nj}A_{nj} = |\mathbf{A}|$$

$$a_{1j}A_{1k} + a_{2j}A_{2k} + \cdots + a_{nj}A_{nk} = 0 \quad \text{if } k \neq j$$

- If all the elements in a row (or column) of \mathbf{A} are 0, then $|\mathbf{A}| = 0$.
- If two rows (or two columns) of \mathbf{A} are interchanged, the determinant changes sign but the absolute value remains unchanged.
- If all the elements in a single row (or column) of \mathbf{A} are multiplied by a number c , the determinant is multiplied by c .
- If two of the rows (or columns) of \mathbf{A} are proportional, then $|\mathbf{A}| = 0$.
- The value of $|\mathbf{A}|$ remains unchanged if a multiple of one row (or one column) is added to another row (or column).
- $|\mathbf{A}'| = |\mathbf{A}|$, where \mathbf{A}' is the transpose of \mathbf{A} .

20.7

$$|\mathbf{AB}| = |\mathbf{A}| \cdot |\mathbf{B}|$$

20.8

$$|\mathbf{A} + \mathbf{B}| \neq |\mathbf{A}| + |\mathbf{B}| \quad (\text{in general})$$

20.9

$$\begin{vmatrix} 1 & x_1 & x_1^2 \\ 1 & x_2 & x_2^2 \\ 1 & x_3 & x_3^2 \end{vmatrix} = (x_2 - x_1)(x_3 - x_1)(x_3 - x_2)$$

The general definition of a determinant of order n , by *cofactor expansion* along the i th row. The value of the determinant is independent of the choice of i .

Expanding a determinant by a row or a column in terms of the cofactors of the same row or column, yields the determinant. Expanding by a row or a column in terms of the cofactors of a different row or column, yields 0.

Important properties of determinants. \mathbf{A} is a square matrix.

Properties of determinants. \mathbf{A} and \mathbf{B} are $n \times n$ matrices.

The *Vandermonde determinant* for $n = 3$.

- 20.10
$$\begin{vmatrix} 1 & x_1 & x_1^2 & \dots & x_1^{n-1} \\ 1 & x_2 & x_2^2 & \dots & x_2^{n-1} \\ 1 & x_3 & x_3^2 & \dots & x_3^{n-1} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & x_n & x_n^2 & \dots & x_n^{n-1} \end{vmatrix} = \prod_{1 \leq j < i \leq n} (x_i - x_j)$$
 The general Vandermonde determinant.
- 20.11
$$\begin{vmatrix} a_1 & 1 & \dots & 1 \\ 1 & a_2 & \dots & 1 \\ \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & \dots & a_n \end{vmatrix} = (a_1 - 1)(a_2 - 1) \cdots (a_n - 1) \left[1 + \sum_{i=1}^n \frac{1}{a_i - 1} \right]$$
 A special determinant.
 $a_i \neq 1$ for $i = 1, \dots, n$.
- 20.12
$$\begin{vmatrix} 0 & p_1 & \dots & p_n \\ q_1 & a_{11} & \dots & a_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ q_n & a_{n1} & \dots & a_{nn} \end{vmatrix} = - \sum_{i=1}^n \sum_{j=1}^n p_i A_{ji} q_j$$
 A useful determinant ($n \geq 2$). A_{ji} is found in (20.5).
- 20.13
$$\begin{vmatrix} \alpha & p_1 & \dots & p_n \\ q_1 & a_{11} & \dots & a_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ q_n & a_{n1} & \dots & a_{nn} \end{vmatrix} = (\alpha - \mathbf{P}'\mathbf{A}^{-1}\mathbf{Q}) |\mathbf{A}|$$
 Generalization of (20.12) when \mathbf{A}^{-1} exists.
 $\mathbf{P}' = (p_1, \dots, p_n)$,
 $\mathbf{Q}' = (q_1, \dots, q_n)$.
- 20.14 $|\mathbf{AB} + \mathbf{I}_m| = |\mathbf{BA} + \mathbf{I}_n|$ A useful result. \mathbf{A} is $m \times n$, \mathbf{B} is $n \times m$.
- 20.15
 - A *minor* of order k in \mathbf{A} is the determinant of a $k \times k$ matrix obtained by deleting all but k rows and all but k columns of \mathbf{A} .
 - A *principal minor* of order k in \mathbf{A} is a minor obtained by deleting all but k rows and all except the k columns with the *same* numbers.
 - The *leading principal minor* of order k in \mathbf{A} is the principal minor obtained by deleting all but the first k rows and the first k columns. Definitions of minors, principal minors, and leading principal minors of a matrix.
- 20.16
$$D_k = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1k} \\ a_{21} & a_{22} & \dots & a_{2k} \\ \vdots & \vdots & \ddots & \vdots \\ a_{k1} & a_{k2} & \dots & a_{kk} \end{vmatrix}, \quad k = 1, 2, \dots, n$$
 The *leading principal minors* of $\mathbf{A} = (a_{ij})_{n \times n}$.

Chapter 21

Eigenvalues. Quadratic forms

- 21.1 A scalar λ is called an *eigenvalue* of an $n \times n$ matrix \mathbf{A} if there exists an n -vector $\mathbf{c} \neq \mathbf{0}$ such that
- $$\mathbf{A}\mathbf{c} = \lambda\mathbf{c}$$
- The vector \mathbf{c} is called an *eigenvector* of \mathbf{A} .
- 21.2
$$|\mathbf{A} - \lambda\mathbf{I}| = \begin{vmatrix} a_{11} - \lambda & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} - \lambda & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} - \lambda \end{vmatrix}$$
- 21.3 λ is an eigenvalue of $\mathbf{A} \Leftrightarrow p(\lambda) = |\mathbf{A} - \lambda\mathbf{I}| = 0$
- 21.4
$$|\mathbf{A}| = \lambda_1 \cdot \lambda_2 \cdots \lambda_{n-1} \cdot \lambda_n$$
$$\text{tr}(\mathbf{A}) = a_{11} + \cdots + a_{nn} = \lambda_1 + \cdots + \lambda_n$$
- 21.5 Let $f(\cdot)$ be a polynomial. If λ is an eigenvalue of \mathbf{A} , then $f(\lambda)$ is an eigenvalue of $f(\mathbf{A})$.
- 21.6 A square matrix \mathbf{A} has an inverse if and only if 0 is not an eigenvalue of \mathbf{A} . If \mathbf{A} has an inverse and λ is an eigenvalue of \mathbf{A} , then λ^{-1} is an eigenvalue of \mathbf{A}^{-1} .
- 21.7 All eigenvalues of \mathbf{A} have moduli (strictly) less than 1 if and only if $\mathbf{A}^t \rightarrow \mathbf{0}$ as $t \rightarrow \infty$.
- 21.8 \mathbf{AB} and \mathbf{BA} have the same eigenvalues.
- 21.9 If \mathbf{A} is symmetric and has only real elements, then all eigenvalues of \mathbf{A} are reals.
- Eigenvalues and eigenvectors are also called *characteristic roots* and *characteristic vectors*. λ and \mathbf{c} may be complex even if \mathbf{A} is real.
- The *eigenvalue polynomial* (the *characteristic polynomial*) of $\mathbf{A} = (a_{ij})_{n \times n}$. \mathbf{I} is the unit matrix of order n .
- A necessary and sufficient condition for λ to be an eigenvalue of \mathbf{A} .
- $\lambda_1, \dots, \lambda_n$ are the eigenvalues of \mathbf{A} .
- Eigenvalues for matrix polynomials.
- How to find the eigenvalues of the inverse of a square matrix.
- An important result.
- \mathbf{A} and \mathbf{B} are $n \times n$ matrices.

If

$$21.10 \quad p(\lambda) = |\mathbf{A} - \lambda \mathbf{I}| = (-\lambda)^n + b_{n-1}(-\lambda)^{n-1} + \cdots + b_1(-\lambda) + b_0$$

is the eigenvalue polynomial of \mathbf{A} , then b_k is the sum of all principal minors of \mathbf{A} of order $n - k$ (there are $\binom{n}{k}$ of them).

Characterization of the coefficients of the eigenvalue polynomial of an $n \times n$ matrix \mathbf{A} . (For principal minors, see (20.15).) $p(\lambda) = 0$ is called the *eigenvalue equation* or *characteristic equation* of \mathbf{A} .

$$21.11 \quad \begin{vmatrix} a_{11} - \lambda & a_{12} \\ a_{21} & a_{22} - \lambda \end{vmatrix} = (-\lambda)^2 + b_1(-\lambda) + b_0$$

where $b_1 = a_{11} + a_{22} = \text{tr}(\mathbf{A})$, $b_0 = |\mathbf{A}|$

(21.10) for $n = 2$. ($\text{tr}(\mathbf{A})$ is the trace of \mathbf{A} .)

$$21.12 \quad \begin{vmatrix} a_{11} - \lambda & a_{12} & a_{13} \\ a_{21} & a_{22} - \lambda & a_{23} \\ a_{31} & a_{32} & a_{33} - \lambda \end{vmatrix} = (-\lambda)^3 + b_2(-\lambda)^2 + b_1(-\lambda) + b_0$$

where

$$b_2 = a_{11} + a_{22} + a_{33} = \text{tr}(\mathbf{A})$$

$$b_1 = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} + \begin{vmatrix} a_{11} & a_{13} \\ a_{31} & a_{33} \end{vmatrix} + \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix}$$

$$b_0 = |\mathbf{A}|$$

(21.10) for $n = 3$.

$$21.13 \quad \mathbf{A} \text{ is diagonalizable} \Leftrightarrow \begin{cases} \mathbf{P}^{-1}\mathbf{A}\mathbf{P} = \mathbf{D} \text{ for} \\ \text{some matrix } \mathbf{P} \text{ and} \\ \text{some diagonal matrix } \mathbf{D}. \end{cases}$$

A definition.

21.14 \mathbf{A} and $\mathbf{P}^{-1}\mathbf{A}\mathbf{P}$ have the same eigenvalues.

21.15 If $\mathbf{A} = (a_{ij})_{n \times n}$ has n distinct eigenvalues, then \mathbf{A} is diagonalizable.

Sufficient (but NOT necessary) condition for \mathbf{A} to be diagonalizable.

21.16 $\mathbf{A} = (a_{ij})_{n \times n}$ has n linearly independent eigenvectors, $\mathbf{x}_1, \dots, \mathbf{x}_n$, with corresponding eigenvalues $\lambda_1, \dots, \lambda_n$, if and only if

$$\mathbf{P}^{-1}\mathbf{A}\mathbf{P} = \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_n \end{pmatrix}$$

where $\mathbf{P} = (\mathbf{x}_1, \dots, \mathbf{x}_n)_{n \times n}$.

A characterization of diagonalizable matrices.

If $\mathbf{A} = (a_{ij})_{n \times n}$ is symmetric, with eigenvalues $\lambda_1, \lambda_2, \dots, \lambda_n$, there exists an orthogonal matrix \mathbf{U} such that

$$21.17 \quad \mathbf{U}^{-1}\mathbf{A}\mathbf{U} = \begin{pmatrix} \lambda_1 & 0 & \dots & 0 \\ 0 & \lambda_2 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda_n \end{pmatrix}$$

The *spectral theorem* for symmetric matrices. For orthogonal matrices, see Chapter 22.

If \mathbf{A} is an $n \times n$ matrix with eigenvalues $\lambda_1, \dots, \lambda_n$ (not necessarily distinct), then there exists an invertible $n \times n$ matrix \mathbf{T} such that

$$21.18 \quad \mathbf{T}^{-1}\mathbf{A}\mathbf{T} = \begin{pmatrix} \mathbf{J}_{k_1}(\lambda_1) & 0 & \dots & 0 \\ 0 & \mathbf{J}_{k_2}(\lambda_2) & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \mathbf{J}_{k_r}(\lambda_r) \end{pmatrix}$$

where $k_1 + k_2 + \dots + k_r = n$ and \mathbf{J}_k is the $k \times k$ matrix

$$\mathbf{J}_k(\lambda) = \begin{pmatrix} \lambda & 1 & 0 & \dots & 0 \\ 0 & \lambda & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & 1 \\ 0 & 0 & 0 & \dots & \lambda \end{pmatrix}, \quad \mathbf{J}_1(\lambda) = \lambda$$

The *Jordan decomposition theorem*.

21.19 Let \mathbf{A} be a complex $n \times n$ matrix. Then there exists a unitary matrix \mathbf{U} such that $\mathbf{U}^{-1}\mathbf{A}\mathbf{U}$ is upper triangular.

Schur's lemma. (For unitary matrices, see (19.50).)

21.20 Let $\mathbf{A} = (a_{ij})$ be a Hermitian matrix. Then there is a unitary matrix \mathbf{U} such that $\mathbf{U}^{-1}\mathbf{A}\mathbf{U}$ is a diagonal matrix. All eigenvalues of \mathbf{A} are then real.

The spectral theorem for Hermitian matrices. (For Hermitian matrices, see (19.50).)

21.21 Given any matrix $\mathbf{A} = (a_{ij})_{n \times n}$, there is for every $\varepsilon > 0$ a matrix $\mathbf{B}_\varepsilon = (b_{ij})_{n \times n}$, with n *distinct* eigenvalues, such that

$$\sum_{i,j=1}^n |a_{ij} - b_{ij}| < \varepsilon$$

By changing the elements of a matrix only slightly one gets a matrix with distinct eigenvalues.

21.22 A square matrix \mathbf{A} satisfies its own eigenvalue equation:

$$p(\mathbf{A}) = (-\mathbf{A})^n + b_{n-1}(-\mathbf{A})^{n-1} + \dots + b_1(-\mathbf{A}) + b_0\mathbf{I} = \mathbf{0}$$

The *Cayley–Hamilton theorem*. The polynomial $p(\cdot)$ is defined in (21.10).

21.23 $\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \Rightarrow \mathbf{A}^2 - \text{tr}(\mathbf{A})\mathbf{A} + |\mathbf{A}|\mathbf{I} = \mathbf{0}$

The Cayley–Hamilton theorem for $n = 2$. (See (21.11).)

21.24
$$Q = \sum_{i=1}^n \sum_{j=1}^n a_{ij}x_i x_j =$$

$$a_{11}x_1^2 + a_{12}x_1x_2 + \cdots + a_{1n}x_1x_n$$

$$+ a_{21}x_2x_1 + a_{22}x_2^2 + \cdots + a_{2n}x_2x_n$$

$$+ \cdots \cdots \cdots$$

$$+ a_{n1}x_nx_1 + a_{n2}x_nx_2 + \cdots + a_{nn}x_n^2$$

A quadratic form in n variables x_1, \dots, x_n . One can assume, without loss of generality, that $a_{ij} = a_{ji}$ for all $i, j = 1, \dots, n$.

21.25
$$Q = \sum_{i=1}^n \sum_{j=1}^n a_{ij}x_i x_j = \mathbf{x}'\mathbf{A}\mathbf{x}, \text{ where}$$

$$\mathbf{x} = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} \text{ and } \mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{pmatrix}$$

A quadratic form in matrix formulation. One can assume, without loss of generality, that \mathbf{A} is symmetric.

- 21.26 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PD $\Leftrightarrow \mathbf{x}'\mathbf{A}\mathbf{x} > 0$ for all $\mathbf{x} \neq \mathbf{0}$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PSD $\Leftrightarrow \mathbf{x}'\mathbf{A}\mathbf{x} \geq 0$ for all \mathbf{x}
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is ND $\Leftrightarrow \mathbf{x}'\mathbf{A}\mathbf{x} < 0$ for all $\mathbf{x} \neq \mathbf{0}$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is NSD $\Leftrightarrow \mathbf{x}'\mathbf{A}\mathbf{x} \leq 0$ for all \mathbf{x}
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is ID $\Leftrightarrow \mathbf{x}'\mathbf{A}\mathbf{x}$ is neither PSD nor NSD

Definiteness types for quadratic forms ($\mathbf{x}'\mathbf{A}\mathbf{x}$) and symmetric matrices (\mathbf{A}). The five types are: *positive definite* (PD), *positive semidefinite* (PSD), *negative definite* (ND), *negative semidefinite* (NSD), and *indefinite* (ID).

- 21.27 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PD $\Rightarrow a_{ii} > 0$ for $i = 1, \dots, n$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PSD $\Rightarrow a_{ii} \geq 0$ for $i = 1, \dots, n$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is ND $\Rightarrow a_{ii} < 0$ for $i = 1, \dots, n$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is NSD $\Rightarrow a_{ii} \leq 0$ for $i = 1, \dots, n$

Let $x_i = 1$ and $x_j = 0$ for $j \neq i$ in (21.24).

- 21.28 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PD \Leftrightarrow all eigenvalues of \mathbf{A} are > 0
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PSD \Leftrightarrow all eigenvalues of \mathbf{A} are ≥ 0
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is ND \Leftrightarrow all eigenvalues of \mathbf{A} are < 0
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is NSD \Leftrightarrow all eigenvalues of \mathbf{A} are ≤ 0

A characterization of definite quadratic forms (matrices) in terms of the signs of the eigenvalues.

- 21.29 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is indefinite (ID) if and only if \mathbf{A} has at least one positive and one negative eigenvalue.

A characterization of *indefinite* quadratic forms.

- 21.30 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PD $\Leftrightarrow D_k > 0$ for $k = 1, \dots, n$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is ND $\Leftrightarrow (-1)^k D_k > 0$ for $k = 1, \dots, n$
 where the *leading principal minors* D_k of \mathbf{A} are
- $$D_k = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1k} \\ a_{21} & a_{22} & \dots & a_{2k} \\ \vdots & \vdots & \ddots & \vdots \\ a_{k1} & a_{k2} & \dots & a_{kk} \end{vmatrix}, \quad k = 1, 2, \dots, n$$
- A characterization of definite quadratic forms (matrices) in terms of leading principal minors. *Note that replacing $>$ by \geq will NOT give criteria for the semidefinite case.* Example: $Q = 0x_1^2 + 0x_1x_2 - x_2^2$.
- 21.31 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is PSD $\Leftrightarrow \Delta_r \geq 0$ for $r = 1, \dots, n$
 $\mathbf{x}'\mathbf{A}\mathbf{x}$ is NSD $\Leftrightarrow (-1)^r \Delta_r \geq 0$ for $r = 1, \dots, n$
 For each r , Δ_r runs through all principal minors of \mathbf{A} of order r .
- Characterizations of positive and negative semidefinite quadratic forms (matrices) in terms of principal minors. (For principal minors, see (20.15).)
- 21.32 If $\mathbf{A} = (a_{ij})_{n \times n}$ is positive definite and \mathbf{P} is $n \times m$ with $r(\mathbf{P}) = m$, then $\mathbf{P}'\mathbf{A}\mathbf{P}$ is positive definite.
- Results on positive definite matrices.
- 21.33 If \mathbf{P} is $n \times m$ and $r(\mathbf{P}) = m$, then $\mathbf{P}'\mathbf{P}$ is positive definite and has rank m .
- 21.34 If \mathbf{A} is positive definite, there exists a nonsingular matrix \mathbf{P} such that $\mathbf{P}\mathbf{A}\mathbf{P}' = \mathbf{I}$ and $\mathbf{P}'\mathbf{P} = \mathbf{A}^{-1}$.
- Let \mathbf{A} be an $m \times n$ matrix with $r(\mathbf{A}) = k$. Then there exist a unitary $m \times m$ matrix \mathbf{U} , a unitary $n \times n$ matrix \mathbf{V} , and a $k \times k$ diagonal matrix \mathbf{D} , with only strictly positive diagonal elements, such that
- $$\mathbf{A} = \mathbf{U}\mathbf{S}\mathbf{V}^*, \quad \text{where } \mathbf{S} = \begin{pmatrix} \mathbf{D} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{pmatrix}$$
- The *singular value decomposition theorem*. The diagonal elements of \mathbf{D} are called *singular values* for the matrix \mathbf{A} . Unitary matrices are defined in (19.50), and orthogonal matrices are defined in (22.8).
- 21.35 If $k = m = n$, then $\mathbf{S} = \mathbf{D}$. If \mathbf{A} is real, \mathbf{U} and \mathbf{V} can be chosen as real, orthogonal matrices.
- 21.36 Let \mathbf{A} and \mathbf{B} be symmetric $n \times n$ matrices. Then there exists an orthogonal matrix \mathbf{Q} such that both $\mathbf{Q}'\mathbf{A}\mathbf{Q}$ and $\mathbf{Q}'\mathbf{B}\mathbf{Q}$ are diagonal matrices, if and only if $\mathbf{A}\mathbf{B} = \mathbf{B}\mathbf{A}$.
- Simultaneous diagonalization.*

The quadratic form

$$(*) \quad Q = \sum_{i=1}^n \sum_{j=1}^n a_{ij} x_i x_j, \quad (a_{ij} = a_{ji})$$

is *positive (negative) definite subject to the linear constraints*

21.37

$$b_{11}x_1 + \cdots + b_{1n}x_n = 0$$

$$(**) \quad \dots\dots\dots (m < n)$$

$$b_{m1}x_1 + \cdots + b_{mn}x_n = 0$$

if $Q > 0$ (< 0) for all $(x_1, \dots, x_n) \neq (0, \dots, 0)$ that satisfy (**).

A definition of positive (negative) definiteness subject to linear constraints.

21.38

$$D_r = \begin{vmatrix} 0 & \cdots & 0 & b_{11} & \cdots & b_{1r} \\ \vdots & \ddots & \vdots & \vdots & & \vdots \\ 0 & \cdots & 0 & b_{m1} & \cdots & b_{mr} \\ b_{11} & \cdots & b_{m1} & a_{11} & \cdots & a_{1r} \\ \vdots & & \vdots & \vdots & \ddots & \vdots \\ b_{1r} & \cdots & b_{mr} & a_{r1} & \cdots & a_{rr} \end{vmatrix}$$

A bordered determinant associated with (21.37), $r = 1, \dots, n$.

Necessary and sufficient conditions for the quadratic form (*) in (21.37) to be positive definite subject to the constraints (**), assuming that the *first* m columns of the matrix $(b_{ij})_{m \times n}$ are linearly independent, is that

21.39

$$(-1)^m D_r > 0, \quad r = m + 1, \dots, n$$

The corresponding conditions for (*) to be negative definite subject to the constraints (**) is that

$$(-1)^r D_r > 0, \quad r = m + 1, \dots, n$$

A test for definiteness of quadratic forms subject to linear constraints. (Assuming that the rank of $(b_{ij})_{m \times n}$ is m is not enough, as is shown by the example, $Q(x_1, x_2, x_3) = x_1^2 + x_2^2 - x_3^2$ with the constraint $x_3 = 0$.)

The quadratic form $ax^2 + 2bxy + cy^2$ is positive for all $(x, y) \neq (0, 0)$ satisfying the constraint $px + qy = 0$, if and only if

21.40

$$\begin{vmatrix} 0 & p & q \\ p & a & b \\ q & b & c \end{vmatrix} < 0$$

A special case of (21.39), assuming $(p, q) \neq (0, 0)$.

References

Most of the formulas can be found in almost any linear algebra text, e.g. Fraleigh and Beauregard (1995) or Lang (1987). See also Horn and Johnson (1985) and Sydsæter et al. (2005). Gantmacher (1959) is a standard reference.

Chapter 22

Special matrices. Leontief systems

Idempotent matrices

- 22.1 $\mathbf{A} = (a_{ij})_{n \times n}$ is *idempotent* $\iff \mathbf{A}^2 = \mathbf{A}$ | Definition of an idempotent matrix.
- 22.2 \mathbf{A} is idempotent $\iff \mathbf{I} - \mathbf{A}$ is idempotent. | Properties of idempotent matrices.
- 22.3 \mathbf{A} is idempotent $\implies 0$ and 1 are the only possible eigenvalues, and \mathbf{A} is positive semidefinite. |
- 22.4 \mathbf{A} is idempotent with k eigenvalues equal to $1 \implies r(\mathbf{A}) = \text{tr}(\mathbf{A}) = k$. |
- 22.5 \mathbf{A} is idempotent and \mathbf{C} is orthogonal $\implies \mathbf{C}'\mathbf{A}\mathbf{C}$ is idempotent. | An orthogonal matrix is defined in (22.8).
- 22.6 \mathbf{A} is idempotent \iff its associated linear transformation is a projection. | A linear transformation P from \mathbb{R}^n into \mathbb{R}^n is a *projection* if $P(P(\mathbf{x})) = P(\mathbf{x})$ for all \mathbf{x} in \mathbb{R}^n .
- 22.7 $\mathbf{I}_n - \mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'$ is idempotent. | \mathbf{X} is $n \times m$, $|\mathbf{X}'\mathbf{X}| \neq 0$.

Orthogonal matrices

- 22.8 $\mathbf{P} = (p_{ij})_{n \times n}$ is *orthogonal* $\iff \mathbf{P}'\mathbf{P} = \mathbf{P}\mathbf{P}' = \mathbf{I}_n$ | Definition of an orthogonal matrix.
- 22.9 \mathbf{P} is orthogonal \iff the column vectors of \mathbf{P} are mutually orthogonal unit vectors. | A property of orthogonal matrices.

- | | | |
|-------|---|---|
| 22.10 | \mathbf{P} and \mathbf{Q} are orthogonal $\Rightarrow \mathbf{PQ}$ is orthogonal. | Properties of orthogonal matrices. |
| 22.11 | \mathbf{P} orthogonal $\Rightarrow \mathbf{P} = \pm 1$, and 1 and -1 are the only possible real eigenvalues. | |
| 22.12 | \mathbf{P} orthogonal $\Leftrightarrow \ \mathbf{Px}\ = \ \mathbf{x}\ $ for all \mathbf{x} in \mathbb{R}^n . | Orthogonal transformations preserve lengths of vectors. |
| 22.13 | If \mathbf{P} is orthogonal, the angle between \mathbf{Px} and \mathbf{Py} equals the angle between \mathbf{x} and \mathbf{y} . | Orthogonal transformations preserve angles. |

Permutation matrices

- | | | |
|-------|--|-------------------------------------|
| 22.14 | $\mathbf{P} = (p_{ij})_{n \times n}$ is a <i>permutation</i> matrix if in each row and each column of \mathbf{P} there is one element equal to 1 and the rest of the elements are 0. | Definition of a permutation matrix. |
| 22.15 | \mathbf{P} is a permutation matrix $\Rightarrow \mathbf{P}$ is nonsingular and orthogonal. | Properties of permutation matrices. |

Nonnegative matrices

- | | | |
|-------|---|--|
| 22.16 | $\mathbf{A} = (a_{ij})_{m \times n} \geq \mathbf{0} \Leftrightarrow a_{ij} \geq 0$ for all i, j
$\mathbf{A} = (a_{ij})_{m \times n} > \mathbf{0} \Leftrightarrow a_{ij} > 0$ for all i, j | Definitions of <i>nonnegative</i> and <i>positive</i> matrices. |
| 22.17 | If $\mathbf{A} = (a_{ij})_{n \times n} \geq \mathbf{0}$, \mathbf{A} has at least one nonnegative eigenvalue. The largest nonnegative eigenvalue is called the <i>Frobenius root</i> of \mathbf{A} and it is denoted by $\lambda(\mathbf{A})$. \mathbf{A} has a nonnegative eigenvector corresponding to $\lambda(\mathbf{A})$. | Definition of the Frobenius root (or <i>dominant root</i>) of a nonnegative matrix. |
| 22.18 | <ul style="list-style-type: none"> • μ is an eigenvalue of $\mathbf{A} \Rightarrow \mu \leq \lambda(\mathbf{A})$ • $\mathbf{0} \leq \mathbf{A}_1 \leq \mathbf{A}_2 \Rightarrow \lambda(\mathbf{A}_1) \leq \lambda(\mathbf{A}_2)$ • $\rho > \lambda(\mathbf{A}) \Leftrightarrow (\rho\mathbf{I} - \mathbf{A})^{-1}$ exists and is $\geq \mathbf{0}$ • $\min_{1 \leq j \leq n} \sum_{i=1}^n a_{ij} \leq \lambda(\mathbf{A}) \leq \max_{1 \leq j \leq n} \sum_{i=1}^n a_{ij}$ | Properties of nonnegative matrices. $\lambda(\mathbf{A})$ is the Frobenius root of A . |

22.19	<p>The matrix $\mathbf{A} = (a_{ij})_{n \times n}$ is <i>decomposable</i> or <i>reducible</i> if by interchanging some rows and the corresponding columns it is possible to transform the matrix \mathbf{A} to</p> $\begin{pmatrix} \mathbf{A}_{11} & \mathbf{A}_{12} \\ \mathbf{0} & \mathbf{A}_{22} \end{pmatrix}$	<p>Definition of a decomposable square matrix. A matrix that is not decomposable (reducible) is called <i>indecomposable</i> (<i>irreducible</i>).</p>
	<p>where \mathbf{A}_{11} and \mathbf{A}_{22} are square submatrices.</p>	
22.20	<p>$\mathbf{A} = (a_{ij})_{n \times n}$ is decomposable if and only if there exists a permutation matrix \mathbf{P} such that</p> $\mathbf{P}^{-1}\mathbf{A}\mathbf{P} = \begin{pmatrix} \mathbf{A}_{11} & \mathbf{A}_{12} \\ \mathbf{0} & \mathbf{A}_{22} \end{pmatrix}$	<p>A characterization of decomposable matrices.</p>
	<p>where \mathbf{A}_{11} and \mathbf{A}_{22} are square submatrices.</p>	
22.21	<p>If $\mathbf{A} = (a_{ij})_{n \times n} \geq \mathbf{0}$ is indecomposable, then</p> <ul style="list-style-type: none"> • the Frobenius root $\lambda(\mathbf{A})$ is > 0, it is a simple root of the eigenvalue equation, and there exists an associated eigenvector $\mathbf{x} > \mathbf{0}$. • If $\mathbf{A}\mathbf{x} = \mu\mathbf{x}$ for some $\mu \geq 0$ and $\mathbf{x} > \mathbf{0}$, then $\mu = \lambda(\mathbf{A})$. 	<p>Properties of indecomposable matrices.</p>
22.22	<p>$\mathbf{A} = (a_{ij})_{n \times n}$ has a <i>dominant diagonal</i> (d.d.) if there exist positive numbers d_1, \dots, d_n such that</p> $d_j a_{jj} > \sum_{i \neq j} d_i a_{ij} \quad \text{for } j = 1, \dots, n$	<p>Definition of a dominant diagonal matrix.</p>
22.23	<p>Suppose \mathbf{A} has a dominant diagonal. Then:</p> <ul style="list-style-type: none"> • $\mathbf{A} \neq 0$. • If the diagonal elements are all positive, then all the eigenvalues of \mathbf{A} have positive real parts. 	<p>Properties of dominant diagonal matrices.</p>
<h3>Leontief systems</h3>		
22.24	<p>If $\mathbf{A} = (a_{ij})_{n \times n} \geq \mathbf{0}$ and $\mathbf{c} \geq \mathbf{0}$, then</p> $\mathbf{A}\mathbf{x} + \mathbf{c} = \mathbf{x}$ <p>is called a <i>Leontief system</i>.</p>	<p>Definition of a Leontief system. \mathbf{x} and \mathbf{c} are $n \times 1$-matrices.</p>
22.25	<p>If $\sum_{i=1}^n a_{ij} < 1$ for $j = 1, \dots, n$, then the Leontief system has a solution $\mathbf{x} \geq \mathbf{0}$.</p>	<p>Sufficient condition for a Leontief system to have a nonnegative solution.</p>

The Leontief system $\mathbf{Ax} + \mathbf{c} = \mathbf{x}$ has a solution $\mathbf{x} \geq \mathbf{0}$ for every $\mathbf{c} \geq \mathbf{0}$, if and only if one (and hence all) of the following equivalent conditions is satisfied:

- 22.26
- The matrix $(\mathbf{I} - \mathbf{A})^{-1}$ exists, is nonnegative, and is equal to $\mathbf{I} + \mathbf{A} + \mathbf{A}^2 + \dots$.
 - $\mathbf{A}^m \rightarrow \mathbf{0}$ as $m \rightarrow \infty$.
 - Every eigenvalue of \mathbf{A} has modulus < 1 .

- $$\begin{vmatrix} 1 - a_{11} & -a_{12} & \dots & -a_{1k} \\ -a_{21} & 1 - a_{22} & \dots & -a_{2k} \\ \vdots & \vdots & \ddots & \vdots \\ -a_{k1} & -a_{k2} & \dots & 1 - a_{kk} \end{vmatrix} > 0$$

for $k = 1, \dots, n$.

- 22.27
- If $0 \leq a_{ii} < 1$ for $i = 1, \dots, n$, and $a_{ij} \geq 0$ for all $i \neq j$, then the system $\mathbf{Ax} + \mathbf{c} = \mathbf{x}$ will have a solution $\mathbf{x} \geq \mathbf{0}$ for every $\mathbf{c} \geq \mathbf{0}$ if and only if $\mathbf{I} - \mathbf{A}$ has a dominant diagonal.

Necessary and sufficient conditions for the Leontief system to have a nonnegative solution. The last conditions are the *Hawkins–Simon conditions*.

A necessary and sufficient condition for the Leontief system to have a nonnegative solution.

References

For the matrix results see Gantmacher (1959) or Horn and Johnson (1985). For Leontief systems, see Nikaido (1970) and Takayama (1985).

Chapter 23

Kronecker products and the vec operator. Differentiation of vectors and matrices

$$23.1 \quad \mathbf{A} \otimes \mathbf{B} = \begin{pmatrix} a_{11}\mathbf{B} & a_{12}\mathbf{B} & \dots & a_{1n}\mathbf{B} \\ a_{21}\mathbf{B} & a_{22}\mathbf{B} & \dots & a_{2n}\mathbf{B} \\ \vdots & \vdots & & \vdots \\ a_{m1}\mathbf{B} & a_{m2}\mathbf{B} & \dots & a_{mn}\mathbf{B} \end{pmatrix}$$

The *Kronecker product* of $\mathbf{A} = (a_{ij})_{m \times n}$ and $\mathbf{B} = (b_{ij})_{p \times q}$. $\mathbf{A} \otimes \mathbf{B}$ is $mp \times nq$. In general, the Kronecker product is not commutative, $\mathbf{A} \otimes \mathbf{B} \neq \mathbf{B} \otimes \mathbf{A}$.

$$23.2 \quad \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \otimes \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix} = \begin{pmatrix} a_{11}b_{11} & a_{11}b_{12} & a_{12}b_{11} & a_{12}b_{12} \\ a_{11}b_{21} & a_{11}b_{22} & a_{12}b_{21} & a_{12}b_{22} \\ a_{21}b_{11} & a_{21}b_{12} & a_{22}b_{11} & a_{22}b_{12} \\ a_{21}b_{21} & a_{21}b_{22} & a_{22}b_{21} & a_{22}b_{22} \end{pmatrix}$$

A special case of (23.1).

$$23.3 \quad \mathbf{A} \otimes \mathbf{B} \otimes \mathbf{C} = (\mathbf{A} \otimes \mathbf{B}) \otimes \mathbf{C} = \mathbf{A} \otimes (\mathbf{B} \otimes \mathbf{C})$$

Valid in general.

$$23.4 \quad (\mathbf{A} + \mathbf{B}) \otimes (\mathbf{C} + \mathbf{D}) = \mathbf{A} \otimes \mathbf{C} + \mathbf{A} \otimes \mathbf{D} + \mathbf{B} \otimes \mathbf{C} + \mathbf{B} \otimes \mathbf{D}$$

Valid if $\mathbf{A} + \mathbf{B}$ and $\mathbf{C} + \mathbf{D}$ are defined.

$$23.5 \quad (\mathbf{A} \otimes \mathbf{B})(\mathbf{C} \otimes \mathbf{D}) = \mathbf{AC} \otimes \mathbf{BD}$$

Valid if \mathbf{AC} and \mathbf{BD} are defined.

$$23.6 \quad (\mathbf{A} \otimes \mathbf{B})' = \mathbf{A}' \otimes \mathbf{B}'$$

Rule for transposing a Kronecker product.

$$23.7 \quad (\mathbf{A} \otimes \mathbf{B})^{-1} = \mathbf{A}^{-1} \otimes \mathbf{B}^{-1}$$

Valid if \mathbf{A}^{-1} and \mathbf{B}^{-1} exist.

$$23.8 \quad \text{tr}(\mathbf{A} \otimes \mathbf{B}) = \text{tr}(\mathbf{A}) \text{tr}(\mathbf{B})$$

\mathbf{A} and \mathbf{B} are square matrices, not necessarily of the same order.

- 23.9 $\alpha \otimes \mathbf{A} = \alpha \mathbf{A} = \mathbf{A} \alpha = \mathbf{A} \otimes \alpha$ | α is a 1×1 scalar matrix.
- 23.10 If $\lambda_1, \dots, \lambda_n$ are the eigenvalues of \mathbf{A} , and if μ_1, \dots, μ_p are the eigenvalues of \mathbf{B} , then the np eigenvalues of $\mathbf{A} \otimes \mathbf{B}$ are $\lambda_i \mu_j$, $i = 1, \dots, n$, $j = 1, \dots, p$. | The eigenvalues of $\mathbf{A} \otimes \mathbf{B}$, where \mathbf{A} is $n \times n$ and \mathbf{B} is $p \times p$.
- 23.11 If \mathbf{x} is an eigenvector of \mathbf{A} , and \mathbf{y} is an eigenvector for \mathbf{B} , then $\mathbf{x} \otimes \mathbf{y}$ is an eigenvector of $\mathbf{A} \otimes \mathbf{B}$. | NOTE: An eigenvector of $\mathbf{A} \otimes \mathbf{B}$ is not necessarily the Kronecker product of an eigenvector of \mathbf{A} and an eigenvector of \mathbf{B} .
- 23.12 If \mathbf{A} and \mathbf{B} are positive (semi-)definite, then $\mathbf{A} \otimes \mathbf{B}$ is positive (semi-)definite. | Follows from (23.10).
- 23.13 $|\mathbf{A} \otimes \mathbf{B}| = |\mathbf{A}|^p \cdot |\mathbf{B}|^n$ | \mathbf{A} is $n \times n$, \mathbf{B} is $p \times p$.
- 23.14 $r(\mathbf{A} \otimes \mathbf{B}) = r(\mathbf{A}) r(\mathbf{B})$ | The rank of a Kronecker product.
- 23.15 If $\mathbf{A} = (\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_n)_{m \times n}$, then $\text{vec}(\mathbf{A}) = \begin{pmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \vdots \\ \mathbf{a}_n \end{pmatrix}_{mn \times 1}$ | $\text{vec}(\mathbf{A})$ consists of the columns of \mathbf{A} placed below each other.
- 23.16 $\text{vec} \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} = \begin{pmatrix} a_{11} \\ a_{21} \\ a_{12} \\ a_{22} \end{pmatrix}$ | A special case of (23.15).
- 23.17 $\text{vec}(\mathbf{A} + \mathbf{B}) = \text{vec}(\mathbf{A}) + \text{vec}(\mathbf{B})$ | Valid if $\mathbf{A} + \mathbf{B}$ is defined.
- 23.18 $\text{vec}(\mathbf{ABC}) = (\mathbf{C}' \otimes \mathbf{A}) \text{vec}(\mathbf{B})$ | Valid if the product \mathbf{ABC} is defined.
- 23.19 $\text{tr}(\mathbf{AB}) = (\text{vec}(\mathbf{A}'))' \text{vec}(\mathbf{B}) = (\text{vec}(\mathbf{B}'))' \text{vec}(\mathbf{A})$ | Valid if the operations are defined.

- 23.29 If $\mathbf{y} = \mathbf{A}(\mathbf{r})\mathbf{x}(\mathbf{r})$, then
- $$\frac{\partial \mathbf{y}}{\partial \mathbf{r}} = (\mathbf{x}' \otimes \mathbf{I}_m) \frac{\partial \mathbf{A}}{\partial \mathbf{r}} + \mathbf{A} \frac{\partial \mathbf{x}}{\partial \mathbf{r}}$$
- | $\mathbf{A}(\mathbf{r})$ is $m \times n$, $\mathbf{x}(\mathbf{r})$ is $n \times 1$ and \mathbf{r} is $k \times 1$.
- 23.30 If $y = f(\mathbf{A})$, then
- $$\frac{\partial y}{\partial \mathbf{A}} = \begin{pmatrix} \frac{\partial y}{\partial a_{11}} & \cdots & \frac{\partial y}{\partial a_{1n}} \\ \vdots & & \vdots \\ \frac{\partial y}{\partial a_{m1}} & \cdots & \frac{\partial y}{\partial a_{mn}} \end{pmatrix}$$
- | Definition of the derivative of a scalar function of an $m \times n$ matrix $\mathbf{A} = (a_{ij})$.
- 23.31 $\frac{\partial |\mathbf{A}|}{\partial \mathbf{A}} = (A_{ij}) = |\mathbf{A}|(\mathbf{A}')^{-1}$
- | \mathbf{A} is $n \times n$. (A_{ij}) is the matrix of cofactors of \mathbf{A} . (See (19.16).) The last equality holds if \mathbf{A} is invertible.
- 23.32 $\frac{\partial \text{tr}(\mathbf{A})}{\partial \mathbf{A}} = \mathbf{I}_n, \quad \frac{\partial \text{tr}(\mathbf{A}'\mathbf{A})}{\partial \mathbf{A}} = 2\mathbf{A}$
- | \mathbf{A} is $n \times n$. $\text{tr}(\mathbf{A})$ is the trace of \mathbf{A} .
- 23.33 $\frac{\partial a^{ij}}{\partial a_{hk}} = -a^{ih}a^{kj}; \quad i, j, h, k = 1, \dots, n$
- | a^{ij} is the (i, j) th element of \mathbf{A}^{-1} .

References

The definitions above are common in the economic literature, see Dhrymes (1978). Magnus and Neudecker (1988) and Lütkepohl (1996) develop a more consistent notation and have all the results quoted here and many more.

Chapter 24

Comparative statics

$$\begin{aligned}
 24.1 \quad & E_1(\mathbf{p}, \mathbf{a}) = S_1(\mathbf{p}, \mathbf{a}) - D_1(\mathbf{p}, \mathbf{a}) \\
 & E_2(\mathbf{p}, \mathbf{a}) = S_2(\mathbf{p}, \mathbf{a}) - D_2(\mathbf{p}, \mathbf{a}) \\
 & \dots\dots\dots \\
 & E_n(\mathbf{p}, \mathbf{a}) = S_n(\mathbf{p}, \mathbf{a}) - D_n(\mathbf{p}, \mathbf{a})
 \end{aligned}$$

$S_i(\mathbf{p}, \mathbf{a})$ is supply and $D_i(\mathbf{p}, \mathbf{a})$ is demand for good i . $E_i(\mathbf{p}, \mathbf{a})$ is excess supply. $\mathbf{p} = (p_1, \dots, p_n)$ is the price vector, $\mathbf{a} = (a_1, \dots, a_k)$ is a vector of exogenous variables.

$$24.2 \quad E_1(\mathbf{p}, \mathbf{a}) = 0, E_2(\mathbf{p}, \mathbf{a}) = 0, \dots, E_n(\mathbf{p}, \mathbf{a}) = 0$$

Conditions for equilibrium.

$$\begin{aligned}
 24.3 \quad & E_1(p_1, p_2, a_1, \dots, a_k) = 0 \\
 & E_2(p_1, p_2, a_1, \dots, a_k) = 0
 \end{aligned}$$

Equilibrium conditions for the two good case.

$$\begin{aligned}
 24.4 \quad & \frac{\partial p_1}{\partial a_j} = \frac{\frac{\partial E_1}{\partial p_2} \frac{\partial E_2}{\partial a_j} - \frac{\partial E_2}{\partial p_2} \frac{\partial E_1}{\partial a_j}}{\frac{\partial E_1}{\partial p_1} \frac{\partial E_2}{\partial p_2} - \frac{\partial E_1}{\partial p_2} \frac{\partial E_2}{\partial p_1}} \\
 & \frac{\partial p_2}{\partial a_j} = \frac{\frac{\partial E_2}{\partial p_1} \frac{\partial E_1}{\partial a_j} - \frac{\partial E_1}{\partial p_1} \frac{\partial E_2}{\partial a_j}}{\frac{\partial E_1}{\partial p_1} \frac{\partial E_2}{\partial p_2} - \frac{\partial E_1}{\partial p_2} \frac{\partial E_2}{\partial p_1}}
 \end{aligned}$$

Comparative statics results for the two good case, $j = 1, \dots, k$.

$$24.5 \quad \begin{pmatrix} \frac{\partial p_1}{\partial a_j} \\ \vdots \\ \frac{\partial p_n}{\partial a_j} \end{pmatrix} = - \begin{pmatrix} \frac{\partial E_1}{\partial p_1} & \cdots & \frac{\partial E_1}{\partial p_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial E_n}{\partial p_1} & \cdots & \frac{\partial E_n}{\partial p_n} \end{pmatrix}^{-1} \begin{pmatrix} \frac{\partial E_1}{\partial a_j} \\ \vdots \\ \frac{\partial E_n}{\partial a_j} \end{pmatrix}$$

Comparative statics results for the n good case, $j = 1, \dots, k$. See (19.16) for the general formula for the inverse of a square matrix.

Consider the problem

$$\max f(\mathbf{x}, \mathbf{a}) \text{ subject to } g(\mathbf{x}, \mathbf{a}) = 0$$

24.6 where f and g are C^1 functions, and let \mathcal{L} be the associated Lagrangian function, with Lagrange multiplier λ . If $x_i^* = x_i^*(\mathbf{a})$, $i = 1, \dots, n$, solves the problem, then for $i, j = 1, \dots, m$,

$$\sum_{k=1}^n L''_{a_i x_k} \frac{\partial x_k^*}{\partial a_j} + g'_{a_i} \frac{\partial \lambda}{\partial a_j} = \sum_{k=1}^n L''_{a_j x_k} \frac{\partial x_k^*}{\partial a_i} + g'_{a_j} \frac{\partial \lambda}{\partial a_i}$$

Reciprocity relations.

$\mathbf{x} = (x_1, \dots, x_n)$ are the decision variables, $\mathbf{a} = (a_1, \dots, a_m)$ are the parameters. For a systematic use of these relations, see Silberberg (1990).

Monotone comparative statics

A function $F : Z \rightarrow \mathbb{R}$, defined on a sublattice Z of \mathbb{R}^m , is called *supermodular* if

$$F(\mathbf{z}) + F(\mathbf{z}') \leq F(\mathbf{z} \wedge \mathbf{z}') + F(\mathbf{z} \vee \mathbf{z}')$$

24.7 for all \mathbf{z} and \mathbf{z}' in Z . If the inequality is strict whenever \mathbf{z} and \mathbf{z}' are not comparable under the preordering \leq , then F is called *strictly supermodular*.

Definition of (strict) supermodularity. See (6.30) and (6.31) for the definition of a sublattice and the lattice operations \wedge and \vee .

Let S and P be sublattices of \mathbb{R}^n and \mathbb{R}^l , respectively. A function $f : S \times P \rightarrow \mathbb{R}$ is said to satisfy *increasing differences* in (\mathbf{x}, \mathbf{p}) if

$$\mathbf{x} \geq \mathbf{x}' \text{ and } \mathbf{p} \geq \mathbf{p}' \Rightarrow$$

$$24.8 \quad f(\mathbf{x}, \mathbf{p}) - f(\mathbf{x}', \mathbf{p}) \geq f(\mathbf{x}, \mathbf{p}') - f(\mathbf{x}', \mathbf{p}')$$

for all pairs (\mathbf{x}, \mathbf{p}) and $(\mathbf{x}', \mathbf{p}')$ in $S \times P$. If the inequality is strict whenever $\mathbf{x} > \mathbf{x}'$ and $\mathbf{p} > \mathbf{p}'$, then f is said to satisfy *strictly increasing differences* in (\mathbf{x}, \mathbf{p}) .

Definition of (strictly) increasing differences. (The difference $f(\mathbf{x}, \mathbf{p}) - f(\mathbf{x}', \mathbf{p})$ between the values of f evaluated at the larger “action” \mathbf{x} and the lesser “action” \mathbf{x}' is a (strictly) increasing function of the parameter \mathbf{p} .)

Let S and P be sublattices of \mathbb{R}^n and \mathbb{R}^l , respectively. If $f : S \times P \rightarrow \mathbb{R}$ is supermodular in (\mathbf{x}, \mathbf{p}) , then

- 24.9
- f is supermodular in \mathbf{x} for fixed \mathbf{p} , i.e. for every fixed \mathbf{p} in P , and for all \mathbf{x} and \mathbf{x}' in S ,

$$f(\mathbf{x}, \mathbf{p}) + f(\mathbf{x}', \mathbf{p}) \leq f(\mathbf{x} \wedge \mathbf{x}', \mathbf{p}) + f(\mathbf{x} \vee \mathbf{x}', \mathbf{p});$$
 - f satisfies increasing differences in (\mathbf{x}, \mathbf{p}) .

Important facts. Note that $S \times P$ is a sublattice of $\mathbb{R}^n \times \mathbb{R}^l = \mathbb{R}^{n+l}$.

Let X be an open sublattice of \mathbb{R}^m . A C^2 function $F : X \rightarrow \mathbb{R}$ is supermodular on X if and only if for all \mathbf{x} in X ,

$$24.10 \quad \frac{\partial^2 F}{\partial x_i \partial x_j}(\mathbf{x}) \geq 0, \quad i, j = 1, \dots, m, \quad i \neq j$$

Suppose that the problem

24.11 $\max F(x, p)$ subject to $x \in S \subset \mathbb{R}$ has at least one solution for each $p \in P \subset \mathbb{R}$. Suppose in addition that F satisfies strictly increasing differences in (x, p) . Then the optimal action $x^*(p)$ is increasing in the parameter p .

A special result that cannot be extended to the case $S \subset \mathbb{R}^n$ for $n \geq 2$.

Suppose in (24.11) that

24.12 $F(x, p) = pf(x) - C(x)$ with S compact and f and C continuous. Then $\partial^2 F / \partial x \partial p = f'(x)$, so according to (24.10), F is supermodular if and only if $f(x)$ is increasing. Thus $f(x)$ increasing is sufficient to ensure that the optimal action $x^*(p)$ is increasing in p .

An important consequence of (24.10).

Suppose S is a compact sublattice of \mathbb{R}^n and P a sublattice of \mathbb{R}^l and $f : S \times P \rightarrow \mathbb{R}$ is a continuous function on S for each fixed \mathbf{p} . Suppose that f satisfies increasing differences in (\mathbf{x}, \mathbf{p}) , and is supermodular in \mathbf{x} for each fixed \mathbf{p} . Let the correspondence Γ from P to S be defined by

$$24.13 \quad \Gamma(\mathbf{p}) = \operatorname{argmax}\{f(\mathbf{x}, \mathbf{p}) : \mathbf{x} \in S\}$$

- For each \mathbf{p} in P , $\Gamma(\mathbf{p})$ is a nonempty compact sublattice of \mathbb{R}^n , and has a greatest element, denoted by $\mathbf{x}^*(\mathbf{p})$.
- $\mathbf{p}_1 > \mathbf{p}_2 \Rightarrow \mathbf{x}^*(\mathbf{p}_1) \geq \mathbf{x}^*(\mathbf{p}_2)$
- If f satisfies strictly increasing differences in (\mathbf{x}, \mathbf{p}) , then $\mathbf{x}_1 \geq \mathbf{x}_2$ for all \mathbf{x}_1 in $\Gamma(\mathbf{p}_1)$ and all \mathbf{x}_2 in $\Gamma(\mathbf{p}_2)$ whenever $\mathbf{p}_1 > \mathbf{p}_2$.

A main result. For a given \mathbf{p} , $\operatorname{argmax}\{f(\mathbf{x}, \mathbf{p}) : \mathbf{x} \in S\}$ is the set of all points \mathbf{x} in S where $f(\mathbf{x}, \mathbf{p})$ attains its maximum value.

Chapter 25

Properties of cost and profit functions

$$25.1 \quad C(\mathbf{w}, y) = \min_{\mathbf{x}} \sum_{i=1}^n w_i x_i \quad \text{when} \quad f(\mathbf{x}) = y$$

Cost minimization.

One output. f is the production function, $\mathbf{w} = (w_1, \dots, w_n)$ are factor prices, y is output and $\mathbf{x} = (x_1, \dots, x_n)$ are factor inputs. $C(\mathbf{w}, y)$ is the cost function.

$$25.2 \quad C(\mathbf{w}, y) = \begin{cases} \text{The minimum cost of producing} \\ y \text{ units of a commodity when fac-} \\ \text{tor prices are } \mathbf{w} = (w_1, \dots, w_n). \end{cases}$$

The *cost function*.

- 25.3
- $C(\mathbf{w}, y)$ is increasing in each w_i .
 - $C(\mathbf{w}, y)$ is homogeneous of degree 1 in \mathbf{w} .
 - $C(\mathbf{w}, y)$ is concave in \mathbf{w} .
 - $C(\mathbf{w}, y)$ is continuous in \mathbf{w} for $\mathbf{w} > \mathbf{0}$.

Properties of the cost function.

$$25.4 \quad x_i^*(\mathbf{w}, y) = \begin{cases} \text{The cost minimizing choice of} \\ \text{the } i\text{th input factor as a func-} \\ \text{tion of the factor prices } \mathbf{w} \text{ and} \\ \text{the production level } y. \end{cases}$$

Conditional factor demand functions.

$\mathbf{x}^*(\mathbf{w}, y)$ is the vector \mathbf{x}^* that solves the problem in (25.1).

- 25.5
- $x_i^*(\mathbf{w}, y)$ is decreasing in w_i .
 - $x_i^*(\mathbf{w}, y)$ is homogeneous of degree 0 in \mathbf{w} .

Properties of the conditional factor demand function.

$$25.6 \quad \frac{\partial C(\mathbf{w}, y)}{\partial w_i} = x_i^*(\mathbf{w}, y), \quad i = 1, \dots, n$$

Shephard's lemma.

$$25.7 \quad \left(\frac{\partial^2 C(\mathbf{w}, y)}{\partial w_i \partial w_j} \right)_{(n \times n)} = \left(\frac{\partial x_i^*(\mathbf{w}, y)}{\partial w_j} \right)_{(n \times n)}$$

is symmetric and negative semidefinite.

Properties of the *substitution matrix*.

25.8	$\pi(p, \mathbf{w}) = \max_{\mathbf{x}} \left(pf(\mathbf{x}) - \sum_{i=1}^n w_i x_i \right)$	The profit maximizing problem of the firm. p is the price of output. $\pi(p, \mathbf{w})$ is the <i>profit function</i> .
25.9	$\pi(p, \mathbf{w}) = \left\{ \begin{array}{l} \text{The maximum profit as a function} \\ \text{of the factor prices } \mathbf{w} \text{ and the out-} \\ \text{put price } p. \end{array} \right.$	The profit function.
25.10	$\pi(p, \mathbf{w}) \equiv \max_y (py - C(\mathbf{w}, y))$	The profit function in terms of costs and revenue.
25.11	<ul style="list-style-type: none"> • $\pi(p, \mathbf{w})$ is increasing in p. • $\pi(p, \mathbf{w})$ is homogeneous of degree 1 in (p, \mathbf{w}). • $\pi(p, \mathbf{w})$ is convex in (p, \mathbf{w}). • $\pi(p, \mathbf{w})$ is continuous in (p, \mathbf{w}) for $\mathbf{w} > \mathbf{0}$, $p > 0$. 	Properties of the profit function.
25.12	$x_i(p, \mathbf{w}) = \left\{ \begin{array}{l} \text{The profit maximizing choice of} \\ \text{the } i\text{th input factor as a function} \\ \text{of the price of output } p \text{ and the} \\ \text{factor prices } \mathbf{w}. \end{array} \right.$	The <i>factor demand functions</i> . $\mathbf{x}(p, \mathbf{w})$ is the vector \mathbf{x} that solves the problem in (25.8).
25.13	<ul style="list-style-type: none"> • $x_i(p, \mathbf{w})$ is decreasing in w_i. • $x_i(p, \mathbf{w})$ is homogeneous of degree 0 in (p, \mathbf{w}). <p>The <i>cross-price effects</i> are symmetric:</p> $\frac{\partial x_i(p, \mathbf{w})}{\partial w_j} = \frac{\partial x_j(p, \mathbf{w})}{\partial w_i}, \quad i, j = 1, \dots, n$	Properties of the factor demand functions.
25.14	$y(p, \mathbf{w}) = \left\{ \begin{array}{l} \text{The profit maximizing output as} \\ \text{a function of the price of output } p \\ \text{and the factor prices } \mathbf{w}. \end{array} \right.$	The <i>supply function</i> $y(p, \mathbf{w}) = f(\mathbf{x}(p, \mathbf{w}))$ is the y that solves the problem in (25.10).
25.15	<ul style="list-style-type: none"> • $y(p, \mathbf{w})$ is increasing in p. • $y(p, \mathbf{w})$ is homogeneous of degree 0 in (p, \mathbf{w}). 	Properties of the supply function.
25.16	$\frac{\partial \pi(p, \mathbf{w})}{\partial p} = y(p, \mathbf{w})$ $\frac{\partial \pi(p, \mathbf{w})}{\partial w_i} = -x_i(p, \mathbf{w}), \quad i = 1, \dots, n$	<i>Hotelling's lemma</i> .

$$25.17 \quad \frac{\partial x_j(p, \mathbf{w})}{\partial w_k} = \frac{\partial x_j^*(\mathbf{w}, y)}{\partial w_k} + \frac{\frac{\partial x_j(p, \mathbf{w})}{\partial p} \frac{\partial y(p, \mathbf{w})}{\partial w_k}}{\frac{\partial y(p, \mathbf{w})}{\partial p}}$$

Puu's equation, $j, k = 1, \dots, n$, shows the substitution and scale effects of an increase in a factor price.

Elasticities of substitution in production theory

$$25.18 \quad \sigma_{yx} = \text{El}_{R_{yx}} \left(\frac{y}{x} \right) = - \frac{\partial \ln \left(\frac{y}{x} \right)}{\partial \ln \left(\frac{p_2}{p_1} \right)}, \quad f(x, y) = c$$

The *elasticity of substitution* between y and x , assuming factor markets are competitive. (See also (5.20).)

$$25.19 \quad \sigma_{ij} = - \frac{\partial \ln \left(\frac{C'_i(\mathbf{w}, y)}{C'_j(\mathbf{w}, y)} \right)}{\partial \ln \left(\frac{w_i}{w_j} \right)}, \quad i \neq j$$

y, C , and w_k (for $k \neq i, j$) are constants.

The *shadow elasticity of substitution* between factor i and factor j .

$$25.20 \quad \sigma_{ij} = \frac{-\frac{C''_{ii}}{(C'_i)^2} + \frac{2C''_{ij}}{C'_i C'_j} - \frac{C''_{jj}}{(C'_j)^2}}{\frac{1}{w_i C'_i} + \frac{1}{w_j C'_j}}, \quad i \neq j$$

An alternative form of (25.19).

$$25.21 \quad A_{ij}(\mathbf{w}, y) = \frac{C(\mathbf{w}, y) C''_{ij}(\mathbf{w}, y)}{C'_i(\mathbf{w}, y) C'_j(\mathbf{w}, y)}, \quad i \neq j$$

The *Allen-Uzawa elasticity of substitution*.

$$25.22 \quad A_{ij}(\mathbf{w}, y) = \frac{\varepsilon_{ij}(\mathbf{w}, y)}{S_j(\mathbf{w}, y)}, \quad i \neq j$$

Here $\varepsilon_{ij}(\mathbf{w}, y)$ is the (constant-output) cross-price elasticity of demand, and $S_j(\mathbf{w}, y) = p_j C_j(\mathbf{w}, y) / C(\mathbf{w}, y)$ is the share of the j th input in total cost.

$$25.23 \quad M_{ij}(\mathbf{w}, y) = \frac{w_i C''_{ij}(\mathbf{w}, y)}{C'_j(\mathbf{w}, y)} - \frac{w_i C''_{ii}(\mathbf{w}, y)}{C'_i(\mathbf{w}, y)} \\ = \varepsilon_{ji}(\mathbf{w}, y) - \varepsilon_{ii}(\mathbf{w}, y), \quad i \neq j$$

The *Morishima elasticity of substitution*.

$$25.24 \quad \text{If } n > 2, \text{ then } M_{ij}(\mathbf{w}, y) = M_{ji}(\mathbf{w}, y) \text{ for all } i \neq j \text{ if and only if all the } M_{ij}(\mathbf{w}, y) \text{ are equal to one and the same constant.}$$

Symmetry of the Morishima elasticity of substitution.

Special functional forms and their properties

The Cobb–Douglas function

$$25.25 \quad y = x_1^{a_1} x_2^{a_2} \cdots x_n^{a_n}$$

The Cobb–Douglas function, defined for $x_i > 0$, $i = 1, \dots, n$. a_1, \dots, a_n are positive constants.

The Cobb–Douglas function in (25.25) is:

- (a) homogeneous of degree $a_1 + \cdots + a_n$,
- 25.26 (b) quasiconcave for all a_1, \dots, a_n ,
- (c) concave if $a_1 + \cdots + a_n \leq 1$,
- (d) strictly concave if $a_1 + \cdots + a_n < 1$.

Properties of the Cobb–Douglas function. (a_1, \dots, a_n are positive constants.)

$$25.27 \quad x_k^*(\mathbf{w}, y) = \left(\frac{a_k}{w_k}\right) \left(\frac{w_1}{a_1}\right)^{\frac{a_1}{s}} \cdots \left(\frac{w_n}{a_n}\right)^{\frac{a_n}{s}} y^{\frac{1}{s}}$$

Conditional factor demand functions with $s = a_1 + \cdots + a_n$.

$$25.28 \quad C(\mathbf{w}, y) = s \left(\frac{w_1}{a_1}\right)^{\frac{a_1}{s}} \cdots \left(\frac{w_n}{a_n}\right)^{\frac{a_n}{s}} y^{\frac{1}{s}}$$

The cost function with $s = a_1 + \cdots + a_n$.

$$25.29 \quad \frac{w_k x_k^*}{C(\mathbf{w}, y)} = \frac{a_k}{a_1 + \cdots + a_n}$$

Factor shares in total costs.

$$25.30 \quad x_k(p, \mathbf{w}) = \frac{a_k}{w_k} (pA)^{\frac{1}{1-s}} \left(\frac{w_1}{a_1}\right)^{\frac{a_1}{s-1}} \cdots \left(\frac{w_n}{a_n}\right)^{\frac{a_n}{s-1}}$$

Factor demand functions with $s = a_1 + \cdots + a_n < 1$.

$$25.31 \quad \pi(p, \mathbf{w}) = (1-s)(p)^{\frac{1}{1-s}} \prod_{i=1}^n \left(\frac{w_i}{a_i}\right)^{-\frac{a_i}{1-s}}$$

The profit function with $s = a_1 + \cdots + a_n < 1$. (If $s = a_1 + \cdots + a_n \geq 1$, there are increasing returns to scale, and the profit maximization problem has no solution.)

The CES (constant elasticity of substitution) function

$$25.32 \quad y = (\delta_1 x_1^{-\rho} + \delta_2 x_2^{-\rho} + \cdots + \delta_n x_n^{-\rho})^{-\mu/\rho}$$

The CES function, defined for $x_i > 0$, $i = 1, \dots, n$. μ and $\delta_1, \dots, \delta_n$ are positive, and $\rho \neq 0$.

The CES function in (25.32) is:

- 25.33
- (a) homogeneous of degree μ
 - (b) quasiconcave for $\rho \geq -1$,
quasiconvex for $\rho \leq -1$
 - (c) concave for $\mu \leq 1$, $\rho \geq -1$
 - (d) convex for $\mu \geq 1$, $\rho \leq -1$
- Properties of the CES function.

25.34

$$x_k^*(\mathbf{w}, y) = \frac{y^{\frac{1}{\rho}} w_k^{r-1}}{a_k^r} \left[\left(\frac{w_1}{a_1} \right)^r + \cdots + \left(\frac{w_n}{a_n} \right)^r \right]^{\frac{1}{\rho}}$$

Conditional factor demand functions with $r = \rho/(\rho + 1)$ and $a_k = \delta_k^{-1/\rho}$.

25.35

$$C(\mathbf{w}, y) = y^{\frac{1}{\mu}} \left[\left(\frac{w_1}{a_1} \right)^r + \cdots + \left(\frac{w_n}{a_n} \right)^r \right]^{\frac{1}{r}}$$

The cost function.

25.36

$$\frac{w_k x_k^*}{C(\mathbf{w}, y)} = \frac{\left(\frac{w_k}{a_k} \right)^r}{\left(\frac{w_1}{a_1} \right)^r + \cdots + \left(\frac{w_n}{a_n} \right)^r}$$

Factor shares in total costs.

Law of the minimum

25.37

$$y = \min(a_1 + b_1 x_1, \dots, a_n + b_n x_n)$$

Law of the minimum. When $a_1 = \cdots = a_n = 0$, this is the *Leontief* or *fixed coefficient function*.

25.38

$$x_k^*(\mathbf{w}, y) = \frac{y - a_k}{b_k}, \quad k = 1, \dots, n$$

Conditional factor demand functions.

25.39

$$C(\mathbf{w}, y) = \left(\frac{y - a_1}{b_1} \right) w_1 + \cdots + \left(\frac{y - a_n}{b_n} \right) w_n$$

The cost function.

The Diewert (generalized Leontief) cost function

25.40

$$C(\mathbf{w}, y) = y \sum_{i,j=1}^n b_{ij} \sqrt{w_i w_j} \quad \text{with } b_{ij} = b_{ji}$$

The *Diewert cost function*.

25.41

$$x_k^*(\mathbf{w}, y) = y \sum_{j=1}^n b_{kj} \sqrt{w_k / w_j}$$

Conditional factor demand functions.

The translog cost function

$$25.42 \quad \ln C(\mathbf{w}, y) = a_0 + c_1 \ln y + \sum_{i=1}^n a_i \ln w_i + \frac{1}{2} \sum_{i,j=1}^n a_{ij} \ln w_i \ln w_j + \sum_{i=1}^n b_i \ln w_i \ln y$$

$$\text{Restrictions: } \sum_{i=1}^n a_i = 1, \quad \sum_{i=1}^n b_i = 0,$$

$$\sum_{j=1}^n a_{ij} = \sum_{i=1}^n a_{ij} = 0, \quad i, j = 1, \dots, n$$

The translog cost function. $a_{ij} = a_{ji}$ for all i and j . The restrictions on the coefficients ensure that $C(\mathbf{w}, y)$ is homogeneous of degree 1.

$$25.43 \quad \frac{w_k x_k^*}{C(\mathbf{w}, y)} = a_k + \sum_{j=1}^n a_{kj} \ln w_j + b_k \ln y$$

Factor shares in total costs.

Chapter 26

Consumer theory

26.1 A *preference relation* \succeq on a set X of commodity vectors $\mathbf{x} = (x_1, \dots, x_n)$ is a complete, reflexive, and transitive binary relation on X with the interpretation

$\mathbf{x} \succeq \mathbf{y}$ means: \mathbf{x} is at least as good as \mathbf{y}

Relations derived from \succeq :

- 26.2
- $\mathbf{x} \sim \mathbf{y} \iff \mathbf{x} \succeq \mathbf{y} \text{ and } \mathbf{y} \succeq \mathbf{x}$
 - $\mathbf{x} \succ \mathbf{y} \iff \mathbf{x} \succeq \mathbf{y} \text{ but not } \mathbf{y} \succeq \mathbf{x}$

- 26.3
- A function $u : X \rightarrow \mathbb{R}$ is a *utility function representing the preference relation* \succeq if

$$\mathbf{x} \succeq \mathbf{y} \iff u(\mathbf{x}) \geq u(\mathbf{y})$$

- For any strictly increasing function $f : \mathbb{R} \rightarrow \mathbb{R}$, $u^*(\mathbf{x}) = f(u(\mathbf{x}))$ is a new utility function representing the same preferences as $u(\cdot)$.

26.4 Let \succeq be a complete, reflexive, and transitive preference relation that is also *continuous* in the sense that the sets

$$\{\mathbf{x} : \mathbf{x} \succeq \mathbf{x}^0\} \text{ and } \{\mathbf{x} : \mathbf{x}^0 \succeq \mathbf{x}\}$$

are both closed for all \mathbf{x}^0 in X . Then \succeq can be represented by a continuous utility function.

26.5 *Utility maximization* subject to a budget constraint:

$$\max_{\mathbf{x}} u(\mathbf{x}) \text{ subject to } \mathbf{p} \cdot \mathbf{x} = \sum_{i=1}^n p_i x_i = m$$

Definition of a preference relation. For binary relations, see (1.16).

$\mathbf{x} \sim \mathbf{y}$ is read “ \mathbf{x} is *indifferent* to \mathbf{y} ”, and $\mathbf{x} \succ \mathbf{y}$ is read “ \mathbf{x} is (*strictly*) *preferred* to \mathbf{y} ”.

A property of utility functions that is invariant under every strictly increasing transformation, is called *ordinal*.

Cardinal properties are those *not* preserved under strictly increasing transformations.

Existence of a continuous utility function. For properties of relations, see (1.16).

$\mathbf{x} = (x_1, \dots, x_n)$ is a vector of (quantities of) commodities, $\mathbf{p} = (p_1, \dots, p_n)$ is the price vector, m is income, and u is the utility function.

26.6	$v(\mathbf{p}, m) = \max_{\mathbf{x}} \{u(\mathbf{x}) : \mathbf{p} \cdot \mathbf{x} = m\}$	The <i>indirect utility function</i> , $v(\mathbf{p}, m)$, is the maximum utility as a function of the price vector \mathbf{p} and the income m .
26.7	<ul style="list-style-type: none"> • $v(\mathbf{p}, m)$ is decreasing in \mathbf{p}. • $v(\mathbf{p}, m)$ is increasing in m. <ul style="list-style-type: none"> • $v(\mathbf{p}, m)$ is homogeneous of degree 0 in (\mathbf{p}, m). • $v(\mathbf{p}, m)$ is quasi-convex in \mathbf{p}. • $v(\mathbf{p}, m)$ is continuous in (\mathbf{p}, m), $\mathbf{p} > \mathbf{0}$, $m > 0$. 	Properties of the indirect utility function.
26.8	$\omega = \frac{u'_1(\mathbf{x})}{p_1} = \dots = \frac{u'_n(\mathbf{x})}{p_n}$	First-order conditions for problem (26.5), with ω as the associated Lagrange multiplier.
26.9	$\omega = \frac{\partial v(\mathbf{p}, m)}{\partial m}$	ω is called the <i>marginal utility</i> of money.
26.10	$x_i(\mathbf{p}, m) = \begin{cases} \text{the optimal choice of the } i\text{th commodity as a function of the price vector } \mathbf{p} \text{ and the income } m. \end{cases}$	The <i>consumer demand functions</i> , or <i>Marshallian demand functions</i> , derived from problem (26.5).
26.11	$\mathbf{x}(t\mathbf{p}, tm) = \mathbf{x}(\mathbf{p}, m)$, t is a positive scalar.	The demand functions are homogeneous of degree 0.
26.12	$x_i(\mathbf{p}, m) = -\frac{\frac{\partial v(\mathbf{p}, m)}{\partial p_i}}{\frac{\partial v(\mathbf{p}, m)}{\partial m}}, \quad i = 1, \dots, n$	<i>Roy's identity</i> .
26.13	$e(\mathbf{p}, u) = \min_{\mathbf{x}} \{\mathbf{p} \cdot \mathbf{x} : u(\mathbf{x}) \geq u\}$	The <i>expenditure function</i> , $e(\mathbf{p}, u)$, is the minimum expenditure at prices \mathbf{p} for obtaining at least the utility level u .
26.14	<ul style="list-style-type: none"> • $e(\mathbf{p}, u)$ is increasing in \mathbf{p}. • $e(\mathbf{p}, u)$ is homogeneous of degree 1 in \mathbf{p}. • $e(\mathbf{p}, u)$ is concave in \mathbf{p}. • $e(\mathbf{p}, u)$ is continuous in \mathbf{p} for $\mathbf{p} > \mathbf{0}$. 	Properties of the expenditure function.

$$26.15 \quad \mathbf{h}(\mathbf{p}, u) = \begin{cases} \text{the expenditure-minimizing bundle} \\ \text{necessary to achieve utility} \\ \text{level } u \text{ at prices } \mathbf{p}. \end{cases}$$

The *Hicksian (or compensated) demand function*. $\mathbf{h}(\mathbf{p}, u)$ is the vector \mathbf{x} that solves the problem $\min_{\mathbf{x}} \{\mathbf{p} \cdot \mathbf{x} : u(\mathbf{x}) \geq u\}$.

$$26.16 \quad \frac{\partial e(\mathbf{p}, u)}{\partial p_i} = h_i(\mathbf{p}, u) \quad \text{for } i = 1, \dots, n$$

Relationship between the expenditure function and the Hicksian demand function.

$$26.17 \quad \frac{\partial h_i(\mathbf{p}, u)}{\partial p_j} = \frac{\partial h_j(\mathbf{p}, u)}{\partial p_i}, \quad i, j = 1, \dots, n$$

Symmetry of the Hicksian cross partials. (The *Marshallian cross partials* need not be symmetric.)

$$26.18 \quad \text{The matrix } \mathbf{S} = (S_{ij})_{n \times n} = \left(\frac{\partial h_i(\mathbf{p}, u)}{\partial p_j} \right)_{n \times n} \text{ is negative semidefinite.}$$

Follows from (26.16) and the concavity of the expenditure function.

$$26.19 \quad e(\mathbf{p}, v(\mathbf{p}, m)) = m : \begin{cases} \text{the minimum expenditure} \\ \text{needed to achieve utility} \\ v(\mathbf{p}, m) \text{ is } m. \end{cases}$$

Useful identities that are valid except in rather special cases.

$$26.20 \quad v(\mathbf{p}, e(\mathbf{p}, u)) = u : \begin{cases} \text{the maximum utility from} \\ \text{income } e(\mathbf{p}, u) \text{ is } u. \end{cases}$$

$$26.21 \quad \text{Marshallian demand at income } m \text{ is Hicksian demand at utility } v(\mathbf{p}, m):$$

$$x_i(\mathbf{p}, m) = h_i(\mathbf{p}, v(\mathbf{p}, m))$$

$$26.22 \quad \text{Hicksian demand at utility } u \text{ is the same as Marshallian demand at income } e(\mathbf{p}, u):$$

$$h_i(\mathbf{p}, u) = x_i(\mathbf{p}, e(\mathbf{p}, u))$$

$$26.23 \quad \begin{aligned} &\bullet e_{ij} = \text{El}_{p_j} x_i = \frac{p_j}{x_i} \frac{\partial x_i}{\partial p_j} \quad (\text{Cournot elasticities}) \\ &\bullet E_i = \text{El}_m x_i = \frac{m}{x_i} \frac{\partial x_i}{\partial m} \quad (\text{Engel elasticities}) \\ &\bullet S_{ij} = \text{El}_{p_j} h_i = \frac{p_j}{x_i} \frac{\partial h_i}{\partial p_j} \quad (\text{Slutsky elasticities}) \end{aligned}$$

e_{ij} are the elasticities of demand w.r.t. prices, E_i are the elasticities of demand w.r.t. income, and S_{ij} are the elasticities of the Hicksian demand w.r.t. prices.

$$26.24 \quad \begin{aligned} &\bullet \frac{\partial x_i(\mathbf{p}, m)}{\partial p_j} = \frac{\partial h_i(\mathbf{p}, u)}{\partial p_j} - x_j(\mathbf{p}, m) \frac{\partial x_i(\mathbf{p}, m)}{\partial m} \\ &\bullet S_{ij} = e_{ij} + a_j E_i, \quad a_j = p_j x_j / m \end{aligned}$$

Two equivalent forms of the *Slutsky equation*.

The following $\frac{1}{2}n(n+1) + 1$ restrictions on the partial derivatives of the demand functions are linearly independent:

$$26.25 \quad (a) \quad \sum_{i=1}^n p_i \frac{\partial x_i(\mathbf{p}, m)}{\partial m} = 1$$

$$(b) \quad \sum_{j=1}^n p_j \frac{\partial x_i}{\partial p_j} + m \frac{\partial x_i}{\partial m} = 0, \quad i = 1, \dots, n$$

$$(c) \quad \frac{\partial x_i}{\partial p_j} + x_j \frac{\partial x_i}{\partial m} = \frac{\partial x_j}{\partial p_i} + x_i \frac{\partial x_j}{\partial m}$$

for $1 \leq i < j \leq n$

(a) is the budget constraint differentiated with respect to m .
 (b) is the Euler equation (for homogeneous functions) applied to the consumer demand function.
 (c) is a consequence of the Slutsky equation and (26.17).

$$EV = e(\mathbf{p}^0, v(\mathbf{p}^1, m^1)) - e(\mathbf{p}^0, v(\mathbf{p}^0, m^0))$$

26.26 EV is the difference between the amount of money needed at the old (period 0) prices to reach the new (period 1) utility level, and the amount of money needed at the old prices to reach the old utility level.

Equivalent variation. \mathbf{p}^0 , m^0 , and \mathbf{p}^1 , m^1 , are prices and income in period 0 and period 1, respectively. $(e(\mathbf{p}^0, v(\mathbf{p}^0, m^0)) = m^0)$.

$$CV = e(\mathbf{p}^1, v(\mathbf{p}^1, m^1)) - e(\mathbf{p}^1, v(\mathbf{p}^0, m^0))$$

26.27 CV is the difference between the amount of money needed at the new (period 1) prices to reach the new utility level, and the amount of money needed at the new prices to reach the old (period 0) utility level.

Compensating variation. \mathbf{p}^0 , m^0 , and \mathbf{p}^1 , m^1 , are prices and income in period 0 and period 1, respectively. $(e(\mathbf{p}^1, v(\mathbf{p}^1, m^1)) = m^1)$.

Special functional forms and their properties

Linear expenditure system (LES)

$$26.28 \quad u(\mathbf{x}) = \prod_{i=1}^n (x_i - c_i)^{\beta_i}, \quad \beta_i > 0$$

The *Stone-Geary* utility function. If $c_i = 0$ for all i , $u(\mathbf{x})$ is Cobb-Douglas.

$$26.29 \quad x_i(\mathbf{p}, m) = c_i + \frac{1}{p_i} \frac{\beta_i}{\beta} \left(m - \sum_{i=1}^n p_i c_i \right)$$

The demand functions. $\beta = \sum_{i=1}^n \beta_i$.

$$26.30 \quad v(\mathbf{p}, m) = \beta^{-\beta} \left(m - \sum_{i=1}^n p_i c_i \right)^{\beta} \prod_{i=1}^n \left(\frac{\beta_i}{p_i} \right)^{\beta_i}$$

The indirect utility function.

$$26.31 \quad e(\mathbf{p}, u) = \sum_{i=1}^n p_i c_i + \frac{\beta u^{1/\beta}}{\left[\prod_{i=1}^n \left(\frac{\beta_i}{p_i} \right)^{\beta_i} \right]^{1/\beta}}$$

The expenditure function.

Almost ideal demand system (AIDS)

$$\ln(e(\mathbf{p}, u)) = a(\mathbf{p}) + ub(\mathbf{p}), \quad \text{where}$$

$$a(\mathbf{p}) = \alpha_0 + \sum_{i=1}^n \alpha_i \ln p_i + \frac{1}{2} \sum_{i,j=1}^n \gamma_{ij}^* \ln p_i \ln p_j$$

$$26.32 \quad \text{and } b(\mathbf{p}) = \beta_0 \prod_{i=1}^n p_i^{\beta_i}, \quad \text{with restrictions}$$

$$\sum_{i=1}^n \alpha_i = 1, \quad \sum_{i=1}^n \beta_i = 0, \quad \text{and } \sum_{i=1}^n \gamma_{ij}^* = \sum_{j=1}^n \gamma_{ij}^* = 0.$$

Almost ideal demand system, defined by the logarithm of the expenditure function. The restrictions make $e(\mathbf{p}, u)$ homogeneous of degree 1 in \mathbf{p} .

$$x_i(\mathbf{p}, m) = \frac{m}{p_i} \left(\alpha_i + \sum_{j=1}^n \gamma_{ij} \ln p_j + \beta_i \ln \left(\frac{m}{P} \right) \right),$$

$$26.33 \quad \text{where the price index } P \text{ is given by}$$

$$\ln P = \alpha_0 + \sum_{i=1}^n \alpha_i \ln p_i + \frac{1}{2} \sum_{i,j=1}^n \gamma_{ij} \ln p_i \ln p_j$$

$$\text{with } \gamma_{ij} = \frac{1}{2}(\gamma_{ij}^* + \gamma_{ji}^*) = \gamma_{ji}$$

The demand functions.

Translog indirect utility function

$$26.34 \quad \ln v(\mathbf{p}, m) = \alpha_0 + \sum_{i=1}^n \alpha_i \ln \left(\frac{p_i}{m} \right) + \frac{1}{2} \sum_{i,j=1}^n \beta_{ij}^* \ln \left(\frac{p_i}{m} \right) \ln \left(\frac{p_j}{m} \right)$$

The translog indirect utility function.

$$26.35 \quad x_i(\mathbf{p}, m) = \frac{m}{p_i} \left(\frac{\alpha_i + \sum_{j=1}^n \beta_{ij} \ln(p_j/m)}{\sum_{i=1}^n \alpha_i + \sum_{i,j=1}^n \beta_{ij}^* \ln(p_i/m)} \right)$$

$$\text{where } \beta_{ij} = \frac{1}{2}(\beta_{ij}^* + \beta_{ji}^*).$$

The demand functions.

Price indices

Consider a “basket” of n commodities. Define for $i = 1, \dots, n$,

$q^{(i)}$ = number of units of good i in the basket

$p_0^{(i)}$ = price per unit of good i in year 0

26.36 $p_t^{(i)}$ = price per unit of good i in year t

A *price index*, P , for year t , with year 0 as the base year, is defined as

$$P = \frac{\sum_{i=1}^n p_t^{(i)} q^{(i)}}{\sum_{i=1}^n p_0^{(i)} q^{(i)}} \cdot 100$$

• If the quantities $q^{(i)}$ in the formula for P are levels of consumption in the base year 0, P is called the *Laspeyres price index*.

26.37 • If the quantities $q^{(i)}$ are levels of consumption in the year t , P is called the *Paasche price index*.

26.38 $F = \sqrt{(\text{Laspeyres index}) \cdot (\text{Paasche index})}$

The most common definition of a price index. P is 100 times the cost of the basket in year t divided by the cost of the basket in year 0.

(More generally, a (consumption) price index can be defined as any function $P(p_1, \dots, p_n)$ of all the prices, homogeneous of degree 1 and increasing in each variable.)

Two important price indices.

Fisher's ideal index.

Varian (1992) is a basic reference. For a more advanced treatment, see Mas-Colell, Whinston, and Green (1995). For AIDS, see Deaton and Muellbauer (1980), for translog, see Christensen, Jorgenson, and Lau (1975). See also Philips (1983).

Chapter 27

Topics from trade theory

27.1 Standard neoclassical trade model (2×2 factor model). Two factors of production, K and L , that are mobile between two output producing sectors A and B . Production functions are neoclassical (i.e. the production set is closed, convex, contains zero, has free disposal, and its intersection with the positive orthant is empty) and exhibit constant returns to scale.

The economy has *incomplete specialization* when both goods are produced.

27.2 Good B is more K intensive than good A if $K_B/L_B > K_A/L_A$ at all factor prices.

No factor intensity reversal (NFIR). K_B denotes use of factor K in producing good B , etc.

Stolper–Samuelson’s theorem:

27.3 In the 2×2 factor model with no factor intensity reversal and incomplete specialization, an increase in the relative price of a good results in an increase in the real return to the factor used intensively in producing that good and a fall in the real return to the other factor.

When B is more K intensive, an increase in the price of B leads to an increase in the real return to K and a decrease in the real return to L . With P as the price of output, r the return to K and w the return to L , r/P_A and r/P_B both rise while w/P_A and w/P_B both fall.

Rybczynski’s theorem:

27.4 In a 2×2 factor model with no factor intensity reversal and incomplete specialization, if the endowment of a factor increases, the output of the good more intensive in that factor will increase while the output of the other good will fall.

Assumes that the endowment of the other factor does not change and that prices of outputs do not change, e.g. if K increases and B is K intensive, then the output of B will rise and the output of A will fall.

Heckscher–Ohlin–Samuelson model:

27.5 Two countries, two traded goods, two non-traded factors of production (K, L). The factors are in fixed supply in the two countries. The two countries have the same constant returns to scale production function for making B and A . Factor markets clear within each country and trade between the two countries clears the markets for the two goods. Each country has a zero balance of payments. Consumers in the two countries have identical homothetic preferences. There is perfect competition and there are no barriers to trade, including tariffs, transactions costs, or transport costs. Both countries' technologies exhibit no factor intensity reversals.

The HOS model.

Heckscher–Ohlin's theorem:

27.6 In the HOS model (27.5) with $K/L > K^*/L^*$ and with B being more K intensive at all factor prices, the home country exports good B .

The quantity version of the H–O model. A * denotes foreign country values and the other country is referred to as the home country.

27.7 In the HOS model (27.5) with neither country specialized in the production of just one good, the price of K is the same in both countries and the price of L is the same in both countries.

Factor price equalization.

Chapter 28

Topics from finance and growth theory

28.1 $S_t = S_{t-1} + rS_{t-1} = (1+r)S_{t-1}, \quad t = 1, 2, \dots$

In an account with interest rate r , an amount S_{t-1} increases after one period to S_t .

28.2 The *compound amount* S_t of a *principal* S_0 at the end of t periods at the interest rate r compounded at the end of each period is

$$S_t = S_0(1+r)^t$$

Compound interest. (The solution to the difference equation in (28.1).)

28.3 The amount S_0 that must be invested at the interest rate r compounded at the end of each period for t periods so that the compound amount will be S_t , is given by

$$S_0 = S_t(1+r)^{-t}$$

S_0 is called the *present value* of S_t .

28.4 When interest is compounded n times a year at regular intervals at the rate of r/n per period, then the effective annual interest is

$$\left(1 + \frac{r}{n}\right)^n - 1$$

Effective annual rate of interest.

28.5
$$A_t = \frac{R}{(1+r)^1} + \frac{R}{(1+r)^2} + \dots + \frac{R}{(1+r)^t}$$
$$= R \frac{1 - (1+r)^{-t}}{r}$$

The *present value* A_t of an *annuity* of R per period for t periods at the interest rate of r per period. Payments at the end of each period.

28.6 The present value A of an annuity of R per period for an infinite number of periods at the interest rate of r per period, is

$$A = \frac{R}{(1+r)^1} + \frac{R}{(1+r)^2} + \dots = \frac{R}{r}$$

The present value of an infinite annuity. First payment after one period.

- 28.7
$$T = \frac{\ln\left(\frac{R}{R - rA}\right)}{\ln(1 + r)}$$
- 28.8
$$S_t = (1 + r)S_{t-1} + (y_t - x_t), \quad t = 1, 2, \dots$$
- 28.9
$$S_t = (1 + r)^t S_0 + \sum_{k=1}^t (1 + r)^{t-k} (y_k - x_k)$$
- 28.10
$$S_t = (1 + r_t)S_{t-1} + (y_t - x_t), \quad t = 1, 2, \dots$$
- 28.11
$$D_k = \frac{1}{\prod_{s=1}^k (1 + r_s)}$$
- 28.12
$$R_k = \frac{D_k}{D_t} = \prod_{s=k+1}^t (1 + r_s)$$
- 28.13
$$S_t = R_0 S_0 + \sum_{k=1}^t R_k (y_k - x_k)$$
- 28.14
$$a_0 + \frac{a_1}{1 + r} + \frac{a_2}{(1 + r)^2} + \dots + \frac{a_n}{(1 + r)^n} = 0$$
- 28.15 If $a_0 < 0$ and a_1, \dots, a_n are all ≥ 0 , then (28.14) has a unique solution $1 + r^* > 0$, i.e. a unique internal rate of return $r^* > -1$. The internal rate of return is positive provided $\sum_{i=0}^n a_i > 0$.
- 28.16
$$A_0 = a_0, A_1 = a_0 + a_1, A_2 = a_0 + a_1 + a_2, \dots, A_n = a_0 + a_1 + \dots + a_n$$
- The number T of periods needed to pay off a loan of A with periodic payment R and interest rate r per period.
- In an account with interest rate r , an amount S_{t-1} increases after one period to S_t , if y_t are the deposits and x_t are the withdrawals in period t .
- The solution of equation (28.8)
- Generalization of (28.8) to the case with a variable interest rate, r_t .
- The *discount factor* associated with (28.10). (Discounted from period k to period 0.)
- The *interest factor* associated with (28.10).
- The solution of (28.10). R_k is defined in (28.12). (Generalizes (28.9).)
- r is the *internal rate of return* of an investment project. Negative a_t represents outlays, positive a_t represents receipts at time t .
- Consequence of Descartes's rule of signs (2.12).
- The *accumulated cash flow* associated with (28.14).

- 28.17 If $A_n \neq 0$, and the sequence A_0, A_1, \dots, A_n changes sign only once, then (28.14) has a unique positive internal rate of return. *Norström's rule.*
- 28.18 The amount in an account after t years if K dollars earn continuous compound interest at the rate r is *Continuous compound interest.*

$$Ke^{rt}$$
- 28.19 The effective annual interest with continuous compounding at the interest rate r is *Effective rate of interest, with continuous compounding.*

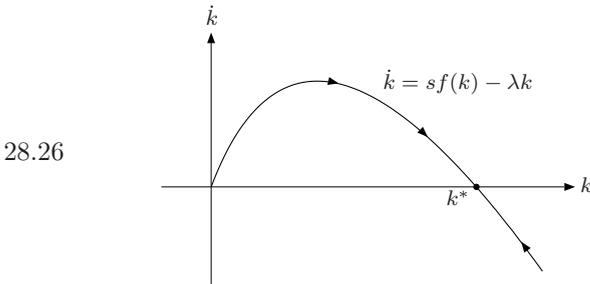

$$e^r - 1$$
- 28.20 Ke^{-rt} , $r = p/100$ *The present value (with continuous compounding) of an amount K due in t years, if the interest is $p\%$ per year.*
- 28.21 The discounted present value at time 0 of a continuous income stream at the rate $K(t)$ dollars per year over the time interval $[0, T]$, and with continuous compounding at the rate of interest r , is *Discounted present value, continuous compounding.*

$$\int_0^T K(t)e^{-rt} dt$$
- 28.22 The discounted present value at time s , of a continuous income stream at the rate $K(t)$ dollars per year over the time interval $[s, T]$, and with continuous compounding at the rate of interest r , is *Discounted present value, continuous compounding.*

$$\int_s^T K(t)e^{-r(t-s)} dt$$
- 28.23 *Solow's growth model:*
 - $X(t) = F(K(t), L(t))$
 - $\dot{K}(t) = sX(t)$
 - $L(t) = L_0e^{\lambda t}$ *$X(t)$ is national income, $K(t)$ is capital, and $L(t)$ is the labor force at time t . F is a production function. s (the savings rate), λ , and L_0 are positive constants.*
- 28.24 If F is homogeneous of degree 1, $k(t) = K(t)/L(t)$ is capital per worker, and $f(k) = F(k, 1)$, then (28.23) reduces to *A simplified version of (28.23).*

$$\dot{k} = sf(k) - \lambda k, \quad k(0) \text{ is given}$$

28.25 If $f(0) = 0$, $\lambda/s < f'(0) < \infty$, $f'(k) \rightarrow 0$ as $k \rightarrow \infty$, and $f''(k) \leq 0$ for all $k \geq 0$, then the equation in (28.24) has a unique solution on $[0, \infty)$ for every positive initial value $k(0)$ of k . The equation has a unique positive equilibrium state k^* , defined by $sf(k^*) = \lambda k^*$. This equilibrium is asymptotically stable on $(0, \infty)$. (See the figure below.)

Existence and uniqueness of solutions of Solow's growth model over $[0, \infty)$. (See Example 5.8.8 in Sydsæter et al. (2005).) The existence of k^* follows immediately from the conditions on f .

Phase diagram for (28.24), with the conditions in (28.25) imposed.

Ramsey's growth model:

28.27

$$\max \int_0^T U(C(t))e^{-rt} dt \quad \text{subject to}$$

$$C(t) = f(K(t)) - \dot{K}(t),$$

$$K(0) = K_0, \quad K(T) \geq K_1.$$

A standard problem in growth theory. U is a utility function, $K(t)$ is the capital stock at time t , $f(K)$ is the production function, $C(t)$ is consumption, r is the discount factor, and T is the planning horizon.

28.28

$$\ddot{K} - f'(K)\dot{K} + \frac{U'(C)}{U''(C)}(r - f'(K)) = 0$$

The Euler equation for problem (28.27).

28.29

$$\frac{\dot{C}}{C} = \frac{f'(K) - r}{-\check{w}}$$

where $\check{w} = \text{El}_C U'(C) = CU''(C)/U'(C)$

Necessary condition for the solution of (28.27). Since \check{w} is usually negative, consumption increases if and only if the marginal productivity of capital exceeds the discount rate.

References

For compound interest formulas, see Goldberg (1961) or Sydsæter and Hammond (2005). For (28.17), see Norstrøm (1972). For growth theory, see Burmeister and Dobell (1970), Blanchard and Fischer (1989), Barro and Sala-i-Martin (1995), or Sydsæter et al. (2005).

Chapter 29

Risk and risk aversion theory

$$29.1 \quad R_A = -\frac{u''(y)}{u'(y)}, \quad R_R = yR_A = -\frac{yu''(y)}{u'(y)}$$

Absolute risk aversion (R_A) and *relative risk aversion* (R_R). $u(y)$ is a utility function, y is income, or consumption.

$$29.2 \quad \begin{aligned} &\bullet R_A = \lambda \Leftrightarrow u(y) = A_1 + A_2 e^{-\lambda y} \\ &\bullet R_R = k \Leftrightarrow u(y) = \begin{cases} A_1 + A_2 \ln y & \text{if } k = 1 \\ A_1 + A_2 y^{1-k} & \text{if } k \neq 1 \end{cases} \end{aligned}$$

A characterization of utility functions with constant absolute and relative risk aversion, respectively. A_1 and A_2 are constants, $A_2 \neq 0$.

$$29.3 \quad \begin{aligned} &\bullet u(y) = y - \frac{1}{2}by^2 \Rightarrow R_A = \frac{b}{1-by} \\ &\bullet u(y) = \frac{1}{b-1}(a+by)^{1-\frac{1}{b}} \Rightarrow R_A = \frac{1}{a+by} \end{aligned}$$

Risk aversions for two special utility functions.

$$29.4 \quad \begin{aligned} E[u(y+z+\pi)] &= E[u(y)] \\ \pi &\approx -\frac{u''(y)}{u'(y)} \frac{\sigma^2}{2} = R_A \frac{\sigma^2}{2} \end{aligned}$$

Arrow-Pratt risk premium. π : risk premium. z : mean zero risky prospect. $\sigma^2 = \text{var}[z]$: variance of z . $E[\]$ is expectation. (Expectation and variance are defined in Chapter 33.)

$$29.5 \quad \begin{aligned} &\text{If } F \text{ and } G \text{ are cumulative distribution functions (CDF) of random incomes, then} \\ &F \text{ first-degree stochastically dominates } G \\ &\iff G(Z) \geq F(Z) \text{ for all } Z \text{ in } I. \end{aligned}$$

Definition of first-degree stochastic dominance. I is a closed interval $[Z_1, Z_2]$. For $Z \leq Z_1$, $F(Z) = G(Z) = 0$ and for $Z \geq Z_2$, $F(Z) = G(Z) = 1$.

$$29.6 \quad F \text{ FSD } G \iff \begin{cases} E_F[u(Z)] \geq E_G[u(Z)] \\ \text{for all increasing } u(Z). \end{cases}$$

An important result. FSD means “first-degree stochastically dominates”. $E_F[u(Z)]$ is expected utility of income Z when the cumulative distribution function is $F(Z)$. $E_G[u(Z)]$ is defined similarly.

$$29.7 \quad T(Z) = \int_{Z_1}^Z (G(z) - F(z)) dz$$

A definition used in (29.8).

$$29.8 \quad \begin{array}{l} F \text{ second-degree stochastically dominates } G \\ \iff T(Z) \geq 0 \text{ for all } Z \text{ in } I. \end{array}$$

Definition of second-degree stochastic dominance (SSD). $I = [Z_1, Z_2]$. Note that $FSD \Rightarrow SSD$.

$$29.9 \quad F \text{ SSD } G \iff \begin{cases} E_F[u(Z)] \geq E_G[u(Z)] \text{ for all} \\ \text{increasing and concave } u(Z). \end{cases}$$

Hadar–Russell’s theorem. Every risk averter prefers F to G if and only if $F \text{ SSD } G$.

Let F and G be distribution functions for X and Y , respectively, let $I = [Z_1, Z_2]$, and let $T(Z)$ be as defined in (29.7). Then the following statements are equivalent:

- 29.10
- $T(Z_2) = 0$ and $T(Z) \geq 0$ for all Z in I .
 - There exists a stochastic variable ε with $E[\varepsilon | X] = 0$ for all X such that Y is distributed as $X + \varepsilon$.
 - F and G have the same mean, and every risk averter prefers F to G .

Rothschild–Stiglitz’s theorem.

Chapter 30

Finance and stochastic calculus

Capital asset pricing model:

$$30.1 \quad E[r_i] = r + \beta_i(E[r_m] - r)$$

where $\beta_i = \frac{\text{corr}(r_i, r_m)\sigma_i}{\sigma_m} = \frac{\text{COV}(r_i, r_m)}{\sigma_m^2}$.

r_i : rate of return on asset i . $E[r_k]$: the expected value of r_k .
 r : rate of return on a safe asset. r_m : market rate of return. σ_i : standard deviation of r_i .

Single consumption β asset pricing equation:

$$30.2 \quad E(r_i) = r + \frac{\beta_{ic}}{\beta_{mc}}(E(r_m) - r),$$

where $\beta_{jc} = \frac{\text{cov}(r_j, d \ln C)}{\text{var}(d \ln C)}$, $j = i$ or m .

C : consumption.
 r_m : return on an arbitrary portfolio.
 $d \ln C$ is the stochastic logarithmic differential. (See (30.13).)

The Black–Scholes option pricing model. (European or American call option on a stock that pays no dividend):

$$30.3 \quad c = c(S, K, t, r, \sigma) = SN(x) - KN(x - \sigma\sqrt{t})e^{-rt},$$

where $x = \frac{\ln(S/K) + (r + \frac{1}{2}\sigma^2)t}{\sigma\sqrt{t}}$,

and $N(y) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^y e^{-z^2/2} dz$ is the cumulative normal distribution function.

c : the value of the option on S at time t . S : underlying stock price, $dS/S = \alpha dt + \sigma dB$, where B is a (standard) Brownian motion, α : drift parameter.
 σ : *volatility* (measures the deviation from the mean). t : time left until expiration. r : interest rate. K : strike price.

$$30.4 \quad \begin{aligned} & \bullet \partial c / \partial S = N(x) > 0 \\ & \bullet \partial c / \partial K = -N(x - \sigma\sqrt{t})e^{-rt} < 0 \\ & \bullet \partial c / \partial t = \frac{\sigma}{2\sqrt{t}} SN'(x) + re^{-rt} KN(x - \sigma\sqrt{t}) > 0 \\ & \bullet \partial c / \partial r = tKN(x - \sigma\sqrt{t})e^{-rt} > 0 \\ & \bullet \partial c / \partial \sigma = SN'(x)\sqrt{t} > 0 \end{aligned}$$

Useful sensitivity results for the Black–Scholes model. (The corresponding results for the generalized Black–Scholes model (30.5) are given in Haug (1997), Appendix B.)

The *generalized Black–Scholes model*, which includes the *cost-of-carry term* b (used to price European call options (c) and put options (p) on assets paying a continuous dividend yield, options on futures, and currency options):

$$30.5 \quad \begin{aligned} c &= SN(x)e^{(b-r)t} - KN(x - \sigma\sqrt{t})e^{-rt}, \\ p &= KN(\sigma\sqrt{t} - x)e^{-rt} - SN(-x)e^{(b-r)t}, \end{aligned}$$

$$\text{where } x = \frac{\ln(S/K) + (b + \frac{1}{2}\sigma^2)t}{\sigma\sqrt{t}}.$$

b : cost-of-carry rate of holding the underlying security. $b = r$ gives the Black–Scholes model. $b = r - q$ gives the Merton stock option model with continuous dividend yield q . $b = 0$ gives the Black futures option model.

$$30.6 \quad p = c - Se^{(b-r)t} + Ke^{-rt}$$

The *put-call parity* for the generalized Black–Scholes model.

$$30.7 \quad P(S, K, t, r, b, \sigma) = C(K, S, t, r - b, -b, \sigma)$$

A transformation that gives the formula for an American put option, P , in terms of the corresponding call option, C .

The market value of an *American perpetual put option* when the underlying asset pays no dividend:

$$30.8 \quad h(x) = \begin{cases} \frac{K}{1 + \gamma} \left(\frac{x}{c}\right)^{-\gamma} & \text{if } x \geq c, \\ K - x & \text{if } x < c, \end{cases}$$

$$\text{where } c = \frac{\gamma K}{1 + \gamma}, \quad \gamma = \frac{2r}{\sigma^2}.$$

x : current price.
 c : trigger price.
 r : interest rate.
 K : exercise price.
 σ : volatility.

$$X_t = X_0 + \int_0^t u(s, \omega) ds + \int_0^t v(s, \omega) dB_s,$$

$$30.9 \quad \begin{aligned} &\text{where } P[\int_0^t v(s, \omega)^2 ds < \infty \text{ for all } t \geq 0] = 1, \\ &\text{and } P[\int_0^t |u(s, \omega)| ds < \infty \text{ for all } t \geq 0] = 1. \\ &\text{Both } u \text{ and } v \text{ are adapted to the filtration } \{\mathcal{F}_t\}, \\ &\text{where } B_t \text{ is an } \mathcal{F}_t\text{-Brownian motion.} \end{aligned}$$

X_t is by definition a one-dimensional *stochastic integral*.

$$30.10 \quad dX_t = u dt + v dB_t$$

A differential form of (30.9).

$$30.11 \quad \text{If } dX_t = u dt + v dB_t \text{ and } Y_t = g(X_t), \text{ where } g \text{ is } C^2, \text{ then}$$

$$dY_t = (g'(X_t)u + \frac{1}{2}g''(X_t)v^2) dt + g'(X_t)v dB_t$$

Itô's formula (one-dimensional).

$$30.12 \quad dt \cdot dt = dt \cdot dB_t = dB_t \cdot dt = 0, \quad dB_t \cdot dB_t = dt$$

Useful relations.

$$\begin{aligned}
 30.13 \quad d \ln X_t &= \left(\frac{u}{X_t} - \frac{v^2}{2X_t^2} \right) dt + \frac{v}{X_t} dB_t \\
 de^{X_t} &= \left(e^{X_t} u + \frac{1}{2} e^{X_t} v^2 \right) dt + e^{X_t} v dB_t
 \end{aligned}$$

Two special cases of (30.11).

$$30.14 \quad \begin{pmatrix} dX_1 \\ \vdots \\ dX_n \end{pmatrix} = \begin{pmatrix} u_1 \\ \vdots \\ u_n \end{pmatrix} dt + \begin{pmatrix} v_{11} & \dots & v_{1m} \\ \vdots & & \vdots \\ v_{n1} & \dots & v_{nm} \end{pmatrix} \begin{pmatrix} dB_1 \\ \vdots \\ dB_m \end{pmatrix}$$

Vector version of (30.10), where B_1, \dots, B_m are m independent one-dimensional Brownian motions.

If $\mathbf{Y} = (Y_1, \dots, Y_k) = \mathbf{g}(t, \mathbf{X})$, where $\mathbf{g} = (g_1, \dots, g_k)$ is C^2 , then for $r = 1, \dots, k$,

$$\begin{aligned}
 30.15 \quad dY_r &= \frac{\partial g_r(t, \mathbf{X})}{\partial t} dt + \sum_{i=1}^n \frac{\partial g_r(t, \mathbf{X})}{\partial x_i} dX_i \\
 &\quad + \frac{1}{2} \sum_{i,j=1}^n \frac{\partial^2 g_r(t, \mathbf{X})}{\partial x_i \partial x_j} dX_i dX_j
 \end{aligned}$$

An n -dimensional version of Itô's formula.

where $dt \cdot dt = dt \cdot dB_i = 0$ and $dB_i \cdot dB_j = dt$ if $i = j$, 0 if $i \neq j$.

$$\begin{aligned}
 30.16 \quad J(t, x) &= \max_u E^{t,x} \left[\int_t^T e^{-rs} W(s, X_s, u_s) ds \right], \\
 &\text{where } T \text{ is fixed, } u_s \in U, U \text{ is a fixed interval,} \\
 &\text{and}
 \end{aligned}$$

$$dX_t = b(t, X_t, u_t) dt + \sigma(t, X_t, u_t) dB_t.$$

A stochastic control problem. J is the value function, u_t is the control. $E^{t,x}$ is expectation subject to the initial condition $X_t = x$.

$$\begin{aligned}
 30.17 \quad -J'_t(t, x) &= \max_{u \in U} [W(t, x, u) \\
 &\quad + J'_x(t, x) b(t, x, u) + \frac{1}{2} J''_{xx}(t, x) (\sigma(t, x, u))^2]
 \end{aligned}$$

The Hamilton-Jacobi-Bellman equation. A necessary condition for optimality in (30.16).

Chapter 31

Non-cooperative game theory

31.1 In an n -person game we assign to each player i ($i = 1, \dots, n$) a *strategy set* S_i and a pure strategy payoff function u_i that gives player i utility $u_i(\mathbf{s}) = u_i(s_1, \dots, s_n)$ for each *strategy profile* $\mathbf{s} = (s_1, \dots, s_n) \in S = S_1 \times \dots \times S_n$.

An n -person game in *strategic* (or *normal*) form. If all the strategy sets S_i have a finite number of elements, the game is called *finite*.

31.2 A strategy profile (s_1^*, \dots, s_n^*) for an n -person game is a *pure strategy Nash equilibrium* if for all $i = 1, \dots, n$ and all s_i in S_i ,

$$u_i(s_1^*, \dots, s_n^*) \geq u_i(s_1^*, \dots, s_{i-1}^*, s_i, s_{i+1}^*, \dots, s_n^*)$$

Definition of a pure strategy Nash equilibrium for an n -person game.

31.3 If for all $i = 1, \dots, n$, the strategy set S_i is a nonempty, compact, and convex subset of \mathbb{R}^m , and $u_i(s_1, \dots, s_n)$ is continuous in $S = S_1 \times \dots \times S_n$ and quasiconcave in its i th variable, then the game has a pure strategy Nash equilibrium.

Sufficient conditions for the existence of a pure strategy Nash equilibrium. (There will usually be several Nash equilibria.)

31.4 Consider a finite n -person game where S_i is player i 's pure strategy set, and let $S = S_1 \times \dots \times S_n$. Let Ω_i be a set of probability distributions over S_i . An element σ_i of Ω_i (σ_i is then a function $\sigma_i : S_i \rightarrow [0, 1]$) is called a *mixed strategy* for player i , with the interpretation that if i plays σ_i , then i chooses the pure strategy s_i with probability $\sigma_i(s_i)$.

Definition of a *mixed strategy* for an n -person game.

If the players choose the *mixed strategy profile* $\boldsymbol{\sigma} = (\sigma_1, \dots, \sigma_n) \in \Omega_1 \times \dots \times \Omega_n$, the probability that the pure strategy profile $\mathbf{s} = (s_1, \dots, s_n)$ occurs is $\sigma_1(s_1) \dots \sigma_n(s_n)$. The expected payoff to player i is then

$$u_i(\boldsymbol{\sigma}) = \sum_{\mathbf{s} \in S} \sigma_1(s_1) \dots \sigma_n(s_n) u_i(\mathbf{s})$$

- 31.5 A mixed strategy profile $\sigma^* = (\sigma_1^*, \dots, \sigma_n^*)$ is a *Nash equilibrium* if for all i and every σ_i ,
- $$u_i(\sigma^*) \geq u_i(\sigma_1^*, \dots, \sigma_{i-1}^*, \sigma_i, \sigma_{i+1}^*, \dots, \sigma_n^*)$$
- Definition of a *mixed strategy Nash equilibrium* for an n -person game.
- σ^* is a Nash equilibrium if and only if the following conditions hold for all $i = 1, \dots, n$:
- 31.6 $\sigma_i^*(s_i) > 0 \Rightarrow u_i(\sigma^*) = u_i(s_i, \sigma_{-i}^*)$ for all s_i
 $\sigma_i^*(s'_i) = 0 \Rightarrow u_i(\sigma^*) \geq u_i(s'_i, \sigma_{-i}^*)$ for all s'_i
- where $\sigma_{-i}^* = (\sigma_1^*, \dots, \sigma_{i-1}^*, \sigma_{i+1}^*, \dots, \sigma_n^*)$ and we consider s_i and s'_i as degenerate mixed strategies.
- An equivalent definition of a (mixed strategy) Nash equilibrium.
- 31.7 Every finite n -person game has a mixed strategy Nash equilibrium.
- An important result.
- The pure strategy $s_i \in S_i$ of player i is *strictly dominated* if there exists a mixed strategy σ_i for player i such that for all feasible combinations of the other players' pure strategies, i 's payoff from playing strategy s_i is strictly less than i 's payoff from playing σ_i :
- 31.8
$$u_i(s_1, \dots, s_{i-1}, s_i, s_{i+1}, \dots, s_n) < u_i(s_1, \dots, s_{i-1}, \sigma_i, s_{i+1}, \dots, s_n)$$
- for every $(s_1, \dots, s_{i-1}, s_{i+1}, \dots, s_n)$ that can be constructed from the other players' strategy sets $S_1, \dots, S_{i-1}, S_{i+1}, \dots, S_n$.
- Definition of strictly dominated strategies.
- In an n -person game, the following results hold:
- 31.9
- If iterated elimination of strictly dominated strategies eliminates all but the strategies (s_1^*, \dots, s_n^*) , then these strategies are the unique Nash equilibrium of the game.
 - If the mixed strategy profile $(\sigma_1^*, \dots, \sigma_n^*)$ is a Nash equilibrium and, for some player i , $\sigma_i^*(s_i) > 0$, then s_i survives iterated elimination of strictly dominated strategies.
- Useful results.
Iterated elimination of strictly dominated strategies need not result in the elimination of any strategy. (For a discussion of iterated elimination of strictly dominated strategies, see the literature.)

A two-person game where the players 1 and 2 have m and n (pure) strategies, respectively, can be represented by the two payoff matrices

$$31.10 \quad \mathbf{A} = \begin{pmatrix} a_{11} & \dots & a_{1n} \\ a_{21} & \dots & a_{2n} \\ \vdots & & \vdots \\ a_{m1} & \dots & a_{mn} \end{pmatrix}, \quad \mathbf{B} = \begin{pmatrix} b_{11} & \dots & b_{1n} \\ b_{21} & \dots & b_{2n} \\ \vdots & & \vdots \\ b_{m1} & \dots & b_{mn} \end{pmatrix}$$

a_{ij} (b_{ij}) is the payoff to player 1 (2) when the players play their pure strategies i and j , respectively. If $\mathbf{A} = -\mathbf{B}$, the game is a *zero-sum* game. The game is *symmetric* if $\mathbf{A} = \mathbf{B}'$.

For the two-person game in (31.10) there exists a Nash equilibrium $(\mathbf{p}^*, \mathbf{q}^*)$ such that

$$31.11 \quad \begin{aligned} &\bullet \mathbf{p} \cdot \mathbf{A}\mathbf{q}^* \leq \mathbf{p}^* \cdot \mathbf{A}\mathbf{q}^* \text{ for all } \mathbf{p} \text{ in } \Delta_m, \\ &\bullet \mathbf{p}^* \cdot \mathbf{B}\mathbf{q} \leq \mathbf{p}^* \cdot \mathbf{B}\mathbf{q}^* \text{ for all } \mathbf{q} \text{ in } \Delta_n. \end{aligned}$$

The existence of a Nash equilibrium for a two-person game. Δ_k denotes the simplex in \mathbb{R}^k consisting of all non-negative vectors whose components sum to one.

In a two-person zero-sum game ($\mathbf{A} = -\mathbf{B}$), the condition for the existence of a Nash equilibrium is equivalent to the condition that $\mathbf{p} \cdot \mathbf{A}\mathbf{q}$ has a *saddle point* $(\mathbf{p}^*, \mathbf{q}^*)$, i.e., for all \mathbf{p} in Δ_m and all \mathbf{q} in Δ_n ,

$$31.12 \quad \mathbf{p} \cdot \mathbf{A}\mathbf{q}^* \leq \mathbf{p}^* \cdot \mathbf{A}\mathbf{q}^* \leq \mathbf{p}^* \cdot \mathbf{A}\mathbf{q}$$

The *saddle point* property of the Nash equilibrium for a two-person zero-sum game.

The equilibrium payoff $v = \mathbf{p}^* \cdot \mathbf{A}\mathbf{q}^*$ is called the *value* of the game, and

$$31.13 \quad v = \min_{\mathbf{q} \in \Delta_n} \max_{\mathbf{p} \in \Delta_m} \mathbf{p} \cdot \mathbf{A}\mathbf{q} = \max_{\mathbf{p} \in \Delta_m} \min_{\mathbf{q} \in \Delta_n} \mathbf{p} \cdot \mathbf{A}\mathbf{q}$$

The classical *minimax theorem* for two-person zero-sum games.

Assume that $(\mathbf{p}^*, \mathbf{q}^*)$ and $(\mathbf{p}^{**}, \mathbf{q}^{**})$ are Nash equilibria in the game (31.10). Then $(\mathbf{p}^*, \mathbf{q}^{**})$ and $(\mathbf{p}^{**}, \mathbf{q}^*)$ are also equilibrium strategy profiles.

31.14 The *rectangular* or *exchangeability* property.

Evolutionary game theory

In the symmetric two-person game of (31.10) with $\mathbf{A} = \mathbf{B}'$, a strategy \mathbf{p}^* is called an *evolutionary stable strategy* if for every $\mathbf{q} \neq \mathbf{p}^*$ there exists an $\bar{\varepsilon} > 0$ such that

$$31.15 \quad \mathbf{q} \cdot \mathbf{A}(\varepsilon\mathbf{q} + (1-\varepsilon)\mathbf{p}^*) < \mathbf{p}^* \cdot \mathbf{A}(\varepsilon\mathbf{q} + (1-\varepsilon)\mathbf{p}^*)$$

for all positive $\varepsilon < \bar{\varepsilon}$.

The value of $\bar{\varepsilon}$ may depend on \mathbf{q} . Biological interpretation: All animals are programmed to play \mathbf{p}^* . Any mutation that tries invasion with \mathbf{q} , has strictly lower fitness.

In the setting (31.15) the strategy \mathbf{p}^* is evolutionary stable if and only if

$$31.16 \quad \mathbf{q} \cdot \mathbf{A}\mathbf{p}^* \leq \mathbf{p}^* \cdot \mathbf{A}\mathbf{p}^* \quad \text{for all } \mathbf{q}.$$

If $\mathbf{q} \neq \mathbf{p}^*$ and $\mathbf{q} \cdot \mathbf{A}\mathbf{p}^* = \mathbf{p}^* \cdot \mathbf{A}\mathbf{p}^*$, then

$$\mathbf{q} \cdot \mathbf{A}\mathbf{q} < \mathbf{p}^* \cdot \mathbf{A}\mathbf{q}.$$

The first condition, (the *equilibrium condition*), is equivalent to the condition for a Nash equilibrium. The second condition is called a *stability condition*.

Games of incomplete information

A *game of incomplete information* assigns to each player $i = 1, \dots, n$ private information $\varphi_i \in \Phi_i$, a strategy set S_i of rules $s_i(\varphi_i)$ and an expected utility function

$$31.17 \quad E_{\Phi}[u_i(s_1(\varphi_1), \dots, s_n(\varphi_n), \varphi)]$$

(The realization of φ_i is known only to player i while the distribution $F(\Phi)$ is common knowledge, $\Phi = \Phi_1 \times \dots \times \Phi_n$. E_{Φ} is the expectation over $\varphi = (\varphi_1, \dots, \varphi_n)$.)

Informally, a game of incomplete information is one where some players do not know the payoffs to the others.)

A strategy profile s^* is a *dominant strategy equilibrium* if for all $i = 1, \dots, n$,

$$31.18 \quad \begin{aligned} u_i(s_1(\varphi_1), \dots, s_i^*(\varphi_i), \dots, s_n(\varphi_n), \varphi) \\ \geq u_i(s_1(\varphi_1), \dots, s_i(\varphi_i), \dots, s_n(\varphi_n), \varphi) \end{aligned}$$

for all φ in Φ and all $\mathbf{s} = (s_1, \dots, s_n)$ in $S = S_1 \times \dots \times S_n$.

Two common solution concepts are dominant strategy equilibrium and Bayesian Nash equilibrium.

A strategy profile \mathbf{s}^* is a *pure strategy Bayesian Nash equilibrium* if for all $i = 1, \dots, n$,

$$31.19 \quad \begin{aligned} E_{\Phi}[u_i(s_1^*(\varphi_1), \dots, s_i^*(\varphi_i), \dots, s_n^*(\varphi_n), \varphi)] \\ \geq E_{\Phi}[u_i(s_1^*(\varphi_1), \dots, s_i(\varphi_i), \dots, s_n^*(\varphi_n), \varphi)] \end{aligned}$$

for all s_i in S_i .

Pure strategy Bayesian Nash equilibrium.

Friedman (1986) is a standard reference. See also Gibbons (1992) (the simplest treatment), Kreps (1990), and Fudenberg and Tirole (1991). For evolutionary game theory, see Weibull (1995). For games of incomplete information, see Mas-Colell, Whinston, and Green (1995).

Chapter 32

Combinatorics

32.1 The number of ways that n objects can be arranged in order is $n! = 1 \cdot 2 \cdot 3 \cdots (n-1) \cdot n$.

5 persons A, B, C, D, and E can be lined up in $5! = 120$ different ways.

32.2 The number of possible ordered subsets of k objects from a set of n objects, is

$$\frac{n!}{(n-k)!} = n(n-1) \cdots (n-k+1)$$

If a lottery has n tickets and k distinct prizes, there are $\frac{n!}{(n-k)!}$ possible lists of prizes.

32.3 Given a collection S_1, S_2, \dots, S_n of disjoint sets containing k_1, k_2, \dots, k_n objects, respectively, there are $k_1 k_2 \cdots k_n$ ways of selecting one object from each set.

If a restaurant has 3 different appetizers, 5 main courses, and 4 desserts, then the total number of possible dinners is $3 \cdot 5 \cdot 4 = 60$.

32.4 A set of n elements has $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ different subsets of k elements.

In a card game you receive 5 cards out of 52. The number of different hands is $\binom{52}{5} = \frac{52!}{5!47!} = 2\,598\,960$.

32.5 The number of ways of arranging n objects of k different types where there are n_1 objects of type 1, n_2 objects of type 2, \dots , and n_k objects of type k is $\frac{n!}{n_1! \cdot n_2! \cdots n_k!}$.

There are $\frac{12!}{5! \cdot 4! \cdot 3!} = 27\,720$ different ways that 12 persons can be allocated to three taxis with 5 in the first, 4 in the second, and 3 in the third.

Let $|X|$ denote the number of elements of a set X . Then

$$\begin{aligned}
 32.6 \quad & \bullet |A \cup B| = |A| + |B| - |A \cap B| \\
 & \bullet |A \cup B \cup C| = |A| + |B| + |C| - |A \cap B| - \\
 & \quad |A \cap C| - |B \cap C| + |A \cap B \cap C|
 \end{aligned}$$

The *inclusion-exclusion principle*, special cases.

$$\begin{aligned}
 32.7 \quad & |A_1 \cup A_2 \cup \cdots \cup A_n| = |A_1| + |A_2| + \cdots + |A_n| \\
 & - |A_1 \cap A_2| - |A_1 \cap A_3| - \cdots - |A_{n-1} \cap A_n| \\
 & + \cdots + (-1)^{n+1} |A_1 \cap A_2 \cap \cdots \cap A_n| \\
 & = \sum (-1)^{r+1} |A_{j_1} \cap A_{j_2} \cap \cdots \cap A_{j_r}|.
 \end{aligned}$$

The sum is taken over all nonempty subsets $\{j_1, j_2, \dots, j_r\}$ of the index set $\{1, 2, \dots, n\}$.

The *inclusion-exclusion principle*.

32.8 If more than k objects are distributed among k boxes (pigeonholes), then some box must contain at least 2 objects. More generally, if at least $nk + 1$ objects are distributed among k boxes (pigeonholes), then some box must contain at least $n + 1$ objects.

Dirichlet's pigeonhole principle. (If $16 = 5 \cdot 3 + 1$ socks are distributed among 3 drawers, then at least one drawer must contain at least 6 socks.)

Chapter 33

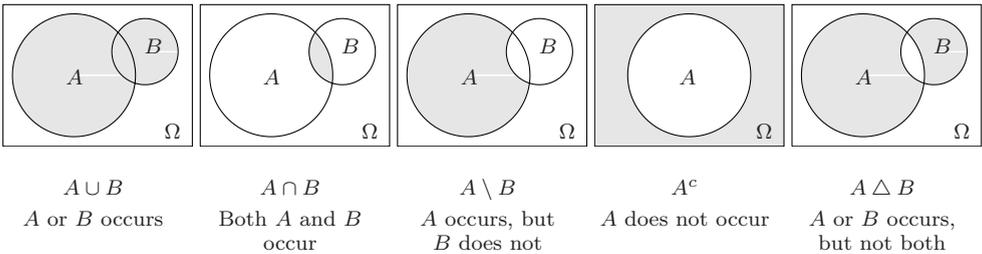

Probability and statistics

The probability $P(A)$ of an event $A \subset \Omega$ satisfies the following axioms:

- 33.1 (a) $0 \leq P(A) \leq 1$
 (b) $P(\Omega) = 1$
 (c) If $A_i \cap A_j = \emptyset$ for $i \neq j$, then

$$P\left(\bigcup_{i=1}^{\infty} A_i\right) = \sum_{i=1}^{\infty} P(A_i)$$

Axioms for probability. Ω is the sample space consisting of all possible outcomes. An event is a subset of Ω .

- 33.2
- $P(A^c) = 1 - P(A)$
 - $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 - $P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(A \cap C) - P(B \cap C) + P(A \cap B \cap C)$
 - $P(A \setminus B) = P(A) - P(A \cap B)$
 - $P(A \Delta B) = P(A) + P(B) - 2P(A \cap B)$

Rules for calculating probabilities.

- 33.3 $P(A|B) = \frac{P(A \cap B)}{P(B)}$ is the *conditional probability* that event A will occur given that B has occurred.

Definition of *conditional probability*, $P(B) > 0$.

- 33.4 A and B are (*stochastically*) *independent* if
- $$P(A \cap B) = P(A)P(B)$$
- If $P(B) > 0$, this is equivalent to
- $$P(A|B) = P(A)$$

Definition of (stochastic) independence.

$$33.5 \quad P(A_1 \cap A_2 \cap \dots \cap A_n) = P(A_1)P(A_2 | A_1) \cdots P(A_n | A_1 \cap A_2 \cap \dots \cap A_{n-1})$$

General multiplication rule for probabilities.

$$33.6 \quad P(A | B) = \frac{P(B | A) \cdot P(A)}{P(B)} \\ = \frac{P(B | A)P(A)}{P(B | A)P(A) + P(B | A^c)P(A^c)}$$

Bayes's rule.
($P(B) \neq 0$.)

$$33.7 \quad P(A_i | B) = \frac{P(B | A_i) \cdot P(A_i)}{\sum_{j=1}^n P(B | A_j) \cdot P(A_j)}$$

Generalized *Bayes's rule.* A_1, \dots, A_n are disjoint, $\sum_{i=1}^n P(A_i) = P(\Omega) = 1$, where $\Omega = \bigcup_{i=1}^n A_i$ is the sample space. B is an arbitrary event.

One-dimensional random variables

$$33.8 \quad \bullet \quad P(X \in A) = \sum_{x \in A} f(x) \\ \bullet \quad P(X \in A) = \int_A f(x) dx$$

f is the discrete/continuous probability density function for the random (or stochastic) variable X .

$$33.9 \quad \bullet \quad F(x) = P(X \leq x) = \sum_{t \leq x} f(t) \\ \bullet \quad F(x) = P(X \leq x) = \int_{-\infty}^x f(t) dt$$

F is the cumulative discrete/continuous distribution function. In the continuous case, $P(X = x) = 0$.

$$33.10 \quad \bullet \quad E[X] = \sum_x xf(x) \\ \bullet \quad E[X] = \int_{-\infty}^{\infty} xf(x) dx$$

Expectation of a random variable X with discrete/continuous probability density function f . $\mu = E[X]$ is called the *mean*.

$$33.11 \quad \bullet \quad E[g(X)] = \sum_x g(x)f(x) \\ \bullet \quad E[g(X)] = \int_{-\infty}^{\infty} g(x)f(x) dx$$

Expectation of a function g of a random variable X with discrete/continuous probability density function f .

$$33.12 \quad \text{var}[X] = E[(X - E[X])^2]$$

The *variance* of a random variable is, by definition, the expected value of its squared deviation from the mean.

$$33.13 \quad \text{var}[X] = E[X^2] - (E[X])^2$$

Another expression for the variance.

$$33.14 \quad \sigma = \sqrt{\text{var}[X]}$$

The *standard deviation* of X .

$$33.15 \quad \text{var}[aX + b] = a^2 \text{var}[X]$$

a and b are real numbers.

$$33.16 \quad \mu_k = E[(X - \mu)^k]$$

The k th *central moment* about the mean, $\mu = E[X]$.

$$33.17 \quad \eta_3 = \frac{\mu_3}{\sigma^3}, \quad \eta_4 = \frac{\mu_4}{\sigma^4} - 3$$

The *coefficient of skewness*, η_3 , and the *coefficient of kurtosis*, η_4 . σ is the standard deviation. For the normal distribution, $\eta_3 = \eta_4 = 0$.

$$33.18 \quad \begin{aligned} &\bullet P(|X| \geq \lambda) \leq E[X^2]/\lambda^2 \\ &\bullet P(|X - \mu| \geq \lambda) \leq \sigma^2/\lambda^2, \quad \lambda > 0 \\ &\bullet P(|X - \mu| \geq k\sigma) \leq 1/k^2, \quad k > 0 \end{aligned}$$

Different versions of *Chebyshev's inequality*. σ is the standard deviation of X , $\mu = E[X]$ is the mean.

If f is convex on the interval I and X is a random variable with finite expectation, then

$$33.19 \quad f(E[X]) \leq E[f(X)]$$

If f is strictly convex, the inequality is strict unless X is a constant with probability 1.

Special case of Jensen's inequality.

$$33.20 \quad \begin{aligned} &\bullet M(t) = E[e^{tX}] = \int_x e^{tx} f(x) \\ &\bullet M(t) = E[e^{tX}] = \int_{-\infty}^{\infty} e^{tx} f(x) dx \end{aligned}$$

Moment generating functions. $M(t)$ does not always exist, but if it does, then
$$M(t) = \sum_{k=0}^{\infty} \frac{E[X^k]}{k!} t^k.$$

$$33.21 \quad \text{If the moment generating function } M(t) \text{ defined in (33.20) exists in an open neighborhood of 0, then } M(t) \text{ uniquely determines the probability distribution function.}$$

An important result.

$$33.22 \quad \begin{aligned} &\bullet C(t) = E[e^{itX}] = \int_x e^{itx} f(x) \\ &\bullet C(t) = E[e^{itX}] = \int_{-\infty}^{\infty} e^{itx} f(x) dx \end{aligned}$$

Characteristic functions. $C(t)$ always exists, and if $E[X^k]$ exists for all k , then
$$C(t) = \sum_{k=0}^{\infty} \frac{i^k E[X^k]}{k!} t^k.$$

33.23 The characteristic function $C(t)$ defined in (33.22) uniquely determines the probability distribution function $f(x)$.

An important result.

Two-dimensional random variables

33.24 • $P((X, Y) \in A) = \sum_{(x,y) \in A} f(x, y)$
 • $P((X, Y) \in A) = \iint_A f(x, y) dx dy$

$f(x, y)$ is the two-dimensional discrete/continuous *simultaneous density function* for the random variables X and Y .

33.25 $F(x, y) = P(X \leq x, Y \leq y) =$
 • $\sum_{u \leq x} \sum_{v \leq y} f(u, v)$ (discrete case)
 • $\int_{-\infty}^x \int_{-\infty}^y f(u, v) du dv$ (continuous case)

F is the simultaneous cumulative discrete/continuous distribution function.

33.26 • $E[g(X, Y)] = \sum_x \sum_y g(x, y) f(x, y)$
 • $E[g(X, Y)] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} g(x, y) f(x, y) dx dy$

The expectation of $g(X, Y)$, where X and Y have the simultaneous discrete/continuous density function f .

33.27 $\text{cov}[X, Y] = E[(X - E[X])(Y - E[Y])]$

Definition of *covariance*.

33.28 $\text{cov}[X, Y] = E[XY] - E[X]E[Y]$

A useful fact.

33.29 If $\text{cov}[X, Y] = 0$, X and Y are *uncorrelated*.

A definition.

33.30 $E[XY] = E[X]E[Y]$ if X and Y are uncorrelated.

Follows from (33.28) and (33.29).

33.31 $(E[XY])^2 \leq E[X^2]E[Y^2]$

Cauchy–Schwarz’s inequality.

33.32 If X and Y are stochastically independent, then $\text{cov}[X, Y] = 0$.

The converse is not true.

33.33 $\text{var}[X \pm Y] = \text{var}[X] + \text{var}[Y] \pm 2 \text{cov}[X, Y]$

The variance of a sum/difference of two random variables.

33.34 $E[a_1 X_1 + \cdots + a_n X_n + b] =$
 $a_1 E[X_1] + \cdots + a_n E[X_n] + b$

X_1, \dots, X_n are random variables and a_1, \dots, a_n, b are real numbers.

- 33.35
$$\begin{aligned} \operatorname{var} \left[\sum_{i=1}^n a_i X_i \right] &= \sum_{i=1}^n \sum_{j=1}^n a_i a_j \operatorname{cov}[X_i, X_j] \\ &= \sum_{i=1}^n a_i^2 \operatorname{var}[X_i] + 2 \sum_{i=1}^{n-1} \sum_{j=i+1}^n a_i a_j \operatorname{cov}[X_i, X_j] \end{aligned}$$
- The variance of a linear combination of random variables.
- 33.36
$$\operatorname{var} \left[\sum_{i=1}^n a_i X_i \right] = \sum_{i=1}^n a_i^2 \operatorname{var}[X_i]$$
- Formula (33.35) when X_1, \dots, X_n are pairwise uncorrelated.
- 33.37
$$\operatorname{corr}[X, Y] = \frac{\operatorname{cov}[X, Y]}{\sqrt{\operatorname{var}[X] \operatorname{var}[Y]}} \in [-1, 1]$$
- Definition of the *correlation coefficient* as a normalized covariance.
- If $f(x, y)$ is a simultaneous density distribution function for X and Y , then
- 33.38
$$\begin{aligned} \bullet \quad f_X(x) &= \sum_y f(x, y), \quad f_Y(y) = \sum_x f(x, y) \\ \bullet \quad f_X(x) &= \int_{-\infty}^{\infty} f(x, y) dy, \quad f_Y(y) = \int_{-\infty}^{\infty} f(x, y) dx \end{aligned}$$
- are the *marginal densities* of X and Y , respectively.
- 33.39
$$f(x|y) = \frac{f(x, y)}{f_Y(y)}, \quad f(y|x) = \frac{f(x, y)}{f_X(x)}$$
- Definitions of *conditional densities*.
- 33.40 The random variables X and Y are *stochastically independent* if $f(x, y) = f_X(x)f_Y(y)$. If $f_Y(y) > 0$, this is equivalent to $f(x|y) = f_X(x)$.
- Stochastic independence.
- 33.41
$$\begin{aligned} \bullet \quad E[X|y] &= \sum_x x f(x|y) \\ \bullet \quad E[X|y] &= \int_{-\infty}^{\infty} x f(x|y) dx \\ \bullet \quad \operatorname{var}[X|y] &= \sum_x (x - E[X|y])^2 f(x|y) \\ \bullet \quad \operatorname{var}[X|y] &= \int_{-\infty}^{\infty} (x - E[X|y])^2 f(x|y) dx \end{aligned}$$
- Definitions of *conditional expectation* and *conditional variance* for discrete and continuous distributions. Note that $E[X|Y = y]$ denotes $E[X|Y = y]$, and $\operatorname{var}[X|y]$ denotes $\operatorname{var}[X|Y = y]$.
- 33.42
$$E[Y] = E_X[E[Y|X]]$$
- Law of *iterated expectations*. E_X denotes expectation w.r.t. X .

$$33.43 \quad E[XY] = E_X[XE[Y|X]] = E[X\mu_{Y|X}].$$

$$33.44 \quad \begin{aligned} \sigma_Y^2 = \text{var}[Y] &= E_X[\text{var}[Y|X]] + \text{var}_X[E[Y|X]] \\ &= E[\sigma_{Y|X}^2] + \text{var}[\mu_{Y|X}] \end{aligned}$$

Let $f(x, y)$ be the density function for a pair (X, Y) of stochastic variables. Suppose that

$$U = \varphi_1(X, Y), \quad V = \varphi_2(X, Y)$$

is a one-to-one C^1 transformation of (X, Y) , with the inverse transformation given by

$$X = \psi_1(U, V), \quad Y = \psi_2(U, V)$$

33.45 Then the density function $g(u, v)$ for the pair (U, V) is given by

$$g(u, v) = f(\psi_1(u, v), \psi_2(u, v)) \cdot |J(u, v)|$$

provided

$$J(u, v) = \begin{vmatrix} \frac{\partial \psi_1(u, v)}{\partial u} & \frac{\partial \psi_1(u, v)}{\partial v} \\ \frac{\partial \psi_2(u, v)}{\partial u} & \frac{\partial \psi_2(u, v)}{\partial v} \end{vmatrix} \neq 0$$

Statistical inference

33.46 If $E[\hat{\theta}] = \theta$ for all θ in Θ , then $\hat{\theta}$ is called an *unbiased estimator* of θ .

If $\hat{\theta}$ is not unbiased,

$$33.47 \quad b = E[\hat{\theta}] - \theta$$

is called the *bias* of $\hat{\theta}$.

$$33.48 \quad \text{MSE}(\hat{\theta}) = E[\hat{\theta} - \theta]^2 = \text{var}[\hat{\theta}] + b^2$$

33.49 $\text{plim } \hat{\theta}_T = \theta$ means that for every $\varepsilon > 0$

$$\lim_{T \rightarrow \infty} P(|\hat{\theta}_T - \theta| < \varepsilon) = 1$$

The expectation of XY is equal to the expected product of X and the conditional expectation of Y given X .

The variance of Y is equal to the expectation of its conditional variances plus the variance of its conditional expectations.

How to find the density function of a transformation of stochastic variables. (The formula generalizes in a straightforward manner to the case with an arbitrary number of stochastic variables. The required regularity conditions are not fully spelled out. See the references.)

$J(u, v)$ is the Jacobian determinant.

Definition of an unbiased estimator. Θ is the parameter space.

Definition of bias.

Definition of *mean square error*, MSE.

Definition of a probability limit. The estimator $\hat{\theta}_T$ is a function of T observations.

33.50	If θ_T has mean μ_T and variance σ_T^2 such that the ordinary limits of μ_T and σ_T^2 are θ and 0 respectively, then θ_T converges in mean square to θ , and $\text{plim } \hat{\theta}_T = \theta$.	Convergence in quadratic mean (mean square convergence).
33.51	If g is continuous, then $\text{plim } g(\theta_T) = g(\text{plim } \theta_T)$	Slutsky's theorem.
33.52	If θ_T and ω_T are random variables with probability limits $\text{plim } \theta_T = \theta$ and $\text{plim } \omega_T = \omega$, then <ul style="list-style-type: none"> • $\text{plim}(\theta_T + \omega_T) = \theta + \omega$ • $\text{plim}(\theta_T \omega_T) = \theta \omega$ • $\text{plim}(\theta_T / \omega_T) = \theta / \omega$ 	Rules for probability limits.
33.53	θ_T converges in distribution to a random variable θ with cumulative distribution function F if $\lim_{T \rightarrow \infty} F_T(\theta) - F(\theta) = 0$ at all continuity points of $F(\theta)$. This is written: $\theta_T \xrightarrow{d} \theta$	Limiting distribution.
33.54	If $\theta_T \xrightarrow{d} \theta$ and $\text{plim}(\omega_T) = \omega$, then <ul style="list-style-type: none"> • $\theta_T \omega_T \xrightarrow{d} \theta \omega$ • If ω_T has a limiting distribution and the limit $\text{plim}(\theta_T - \omega_T) = 0$, then θ_T has the same limiting distribution as ω_T. 	Rules for limiting distributions.
33.55	$\hat{\theta}$ is a consistent estimator of θ if $\text{plim } \hat{\theta}_T = \theta$ for every $\theta \in \Theta$.	Definition of consistency.
33.56	$\hat{\theta}$ is asymptotically unbiased if $\lim_{T \rightarrow \infty} E[\hat{\theta}_T] = \theta$ for every $\theta \in \Theta$.	Definition of an asymptotically unbiased estimator.
33.57	H_0 Null hypothesis (e.g. $\theta \leq 0$). H_1 Alternate hypothesis (e.g. $\theta > 0$). T Test statistic. C Critical region. θ An unknown parameter.	Definitions for <i>statistical testing</i> .
33.58	A test: Reject H_0 in favor of H_1 if $T \in C$.	A test.
33.59	The power function of a test is $\pi(\theta) = P(\text{reject } H_0 \theta)$, $\theta \in \Theta$.	Definition of the <i>power</i> of a test.

- | | | |
|-------|---|--|
| 33.60 | To reject H_0 when H_0 is true is called a type I error.
Not to reject H_0 when H_1 is true is called a type II error. | Type I and II errors. |
| 33.61 | α -level of significance: The least α such that $P(\text{type I error}) \leq \alpha$ for all θ satisfying H_0 . | The α -level of significance of a test. |
| 33.62 | Significance probability (or P -value) is the least level of significance that leads to rejection of H_0 , given the data and the test. | An important concept. |

Asymptotic results

- | | | |
|-------|--|---|
| 33.63 | Let $\{X_i\}$ be a sequence of independent and identically distributed random variables, with finite mean $E[X_i] = \mu$. Let $S_n = X_1 + \dots + X_n$. Then:
(1) For every $\varepsilon > 0$,
$P \left\{ \left \frac{S_n}{n} - \mu \right < \varepsilon \right\} \rightarrow 1 \text{ as } n \rightarrow \infty.$ (2) With probability 1, $\frac{S_n}{n} \rightarrow \mu$ as $n \rightarrow \infty$. | (1) is the <i>weak law of large numbers</i> . S_n/n is a consistent estimator for μ . (2) is the <i>strong law of large numbers</i> . |
|-------|--|---|

- | | | |
|-------|--|------------------------------------|
| 33.64 | Let $\{X_i\}$ be a sequence of independent and identically distributed random variables with finite mean $E[X_i] = \mu$ and finite variance $\text{var}[X_i] = \sigma^2$. Let $S_n = X_1 + \dots + X_n$. Then the distribution of $\frac{S_n - n\mu}{\sigma\sqrt{n}}$ tends to the standard normal distribution as $n \rightarrow \infty$, i.e.
$P \left\{ \frac{S_n - n\mu}{\sigma\sqrt{n}} \leq a \right\} \rightarrow \frac{1}{\sqrt{2\pi}} \int_{-\infty}^a e^{-x^2/2} dx$ as $n \rightarrow \infty$. | The <i>central limit theorem</i> . |
|-------|--|------------------------------------|

Chapter 34

Probability distributions

$$f(x) = \begin{cases} \frac{x^{p-1}(1-x)^{q-1}}{B(p, q)}, & x \in (0, 1), \\ 0 & \text{otherwise,} \end{cases}$$

$$p > 0, q > 0.$$

34.1 Mean: $E[X] = \frac{p}{p+q}$.

$$\text{Variance: } \text{var}[X] = \frac{pq}{(p+q)^2(p+q+1)}.$$

$$k\text{th moment: } E[X^k] = \frac{B(p+k, q)}{B(p, q)}.$$

Beta distribution. B is the beta function defined in (9.61).

$$f(x) = \binom{n}{x} p^x (1-p)^{n-x},$$

$$x = 0, 1, \dots, n; \quad n = 1, 2, \dots; \quad p \in (0, 1).$$

34.2 Mean: $E[X] = np$.

$$\text{Variance: } \text{var}[X] = np(1-p).$$

$$\text{Moment generating function: } [pe^t + (1-p)]^n.$$

$$\text{Characteristic function: } [pe^{it} + (1-p)]^n.$$

Binomial distribution. $f(x)$ is the probability for an event to occur exactly x times in n independent observations, when the probability of the event is p at each observation. For $\binom{n}{x}$, see (8.30).

$$f(x, y) = \frac{e^{-Q}}{2\pi\sigma\tau\sqrt{1-\rho^2}}, \quad \text{where}$$

34.3
$$Q = \frac{\left(\frac{x-\mu}{\sigma}\right)^2 - 2\rho\frac{(x-\mu)(y-\eta)}{\sigma\tau} + \left(\frac{y-\eta}{\tau}\right)^2}{2(1-\rho^2)},$$

$$x, y, \mu, \eta \in (-\infty, \infty), \quad \sigma > 0, \quad \tau > 0, \quad |\rho| < 1.$$

$$\text{Mean: } E[X] = \mu, \quad E[Y] = \eta.$$

$$\text{Variance: } \text{var}[X] = \sigma^2, \quad \text{var}[Y] = \tau^2.$$

$$\text{Covariance: } \text{cov}[X, Y] = \rho\sigma\tau.$$

Binormal distribution. (For moment generating and characteristic functions, see the more general multivariate normal distribution in (34.15).)

- 34.4
$$f(x) = \begin{cases} \frac{x^{\frac{1}{2}\nu-1}e^{-\frac{1}{2}x}}{2^{\frac{1}{2}\nu}\Gamma(\frac{1}{2}\nu)}, & x > 0 \\ 0, & x \leq 0 \end{cases}; \quad \nu = 1, 2, \dots$$
 Mean: $E[X] = \nu$.
Variance: $\text{var}[X] = 2\nu$.
Moment generating function: $(1 - 2t)^{-\frac{1}{2}\nu}$, $t < \frac{1}{2}$.
Characteristic function: $(1 - 2it)^{-\frac{1}{2}\nu}$.
- Chi-square distribution* with ν degrees of freedom. Γ is the gamma function defined in (9.53).
- 34.5
$$f(x) = \begin{cases} \lambda e^{-\lambda x}, & x > 0 \\ 0, & x \leq 0 \end{cases}; \quad \lambda > 0.$$
 Mean: $E[X] = 1/\lambda$.
Variance: $\text{var}[X] = 1/\lambda^2$.
Moment generating function: $\lambda/(\lambda - t)$, $t < \lambda$.
Characteristic function: $\lambda/(\lambda - it)$.
- Exponential distribution.*
- 34.6
$$f(x) = \frac{1}{\beta} e^{-z} e^{-e^{-z}}, \quad z = \frac{x - \alpha}{\beta}, \quad x \in \mathbb{R}, \quad \beta > 0$$
 Mean: $E[X] = \alpha - \beta\Gamma'(1)$.
Variance: $\text{var}[X] = \beta^2\pi^2/6$.
Moment gen. function: $e^{\alpha t}\Gamma(1 - \beta t)$, $t < 1/\beta$.
Characteristic function: $e^{i\alpha t}\Gamma(1 - i\beta t)$.
- Extreme value (Gumbel) distribution.* $\Gamma'(1)$ is the derivative of the gamma function at 1. (See (9.53).) $\Gamma'(1) = -\gamma$, where $\gamma \approx 0.5772$ is Euler's constant, see (8.48).
- 34.7
$$f(x) = \begin{cases} \frac{\nu_1^{\frac{1}{2}\nu_1} \nu_2^{\frac{1}{2}\nu_2} x^{\frac{1}{2}\nu_1-1}}{B(\frac{1}{2}\nu_1, \frac{1}{2}\nu_2)(\nu_2 + \nu_1 x)^{\frac{1}{2}(\nu_1+\nu_2)}}, & x > 0 \\ 0, & x \leq 0 \end{cases}$$

 $\nu_1, \nu_2 = 1, 2, \dots$
Mean: $E[X] = \nu_2/(\nu_2 - 2)$ for $\nu_2 > 2$
(does not exist for $\nu_2 = 1, 2$).
Variance: $\text{var}[X] = \frac{2\nu_2^2(\nu_1 + \nu_2 - 2)}{\nu_1(\nu_2 - 2)^2(\nu_2 - 4)}$ for $\nu_2 > 4$
(does not exist for $\nu_2 \leq 4$).
 k th moment:
$$E[X^k] = \frac{\Gamma(\frac{1}{2}\nu_1 + k)\Gamma(\frac{1}{2}\nu_2 - k)}{\Gamma(\frac{1}{2}\nu_1)\Gamma(\frac{1}{2}\nu_2)} \left(\frac{\nu_2}{\nu_1}\right)^k, \quad 2k < \nu_2$$
- F-distribution.* B is the beta function defined in (9.61). ν_1, ν_2 are the degrees of freedom for the numerator and denominator, respectively.
- 34.8
$$f(x) = \begin{cases} \frac{\lambda^n x^{n-1} e^{-\lambda x}}{\Gamma(n)}, & x > 0 \\ 0, & x \leq 0 \end{cases}; \quad n, \lambda > 0.$$
 Mean: $E[X] = n/\lambda$.
Variance: $\text{var}[X] = n/\lambda^2$.
Moment generating function: $[\lambda/(\lambda - t)]^n$, $t < \lambda$.
Characteristic function: $[\lambda/(\lambda - it)]^n$.
- Gamma distribution.* Γ is the gamma function defined in (9.53). For $n = 1$ this is the exponential distribution.

- 34.9 $f(x) = p(1-p)^x; \quad x = 0, 1, 2, \dots, \quad p \in (0, 1).$
 Mean: $E[X] = (1-p)/p.$
 Variance: $\text{var}[X] = (1-p)/p^2.$
 Moment generating function:
 $p/[1 - (1-p)e^t], \quad t < -\ln(1-p).$
 Characteristic function: $p/[1 - (1-p)e^{it}].$
Geometric distribution.
- 34.10 $f(x) = \frac{\binom{M}{x} \binom{N-M}{n-x}}{\binom{N}{n}},$
 $x = 0, 1, \dots, n; \quad n = 1, 2, \dots, N.$
 Mean: $E[X] = nM/N.$
 Variance: $\text{var}[X] = np(1-p)(N-n)/(N-1),$
 where $p = M/N.$
Hypergeometric distribution. Given a collection of N objects, where M objects have a certain characteristic and $N-M$ do not have it. Pick n objects at random from the collection. $f(x)$ is then the probability that x objects have the characteristic and $n-x$ do not have it.
- 34.11 $f(x) = \frac{1}{2\beta} e^{-|x-\alpha|/\beta}; \quad x \in \mathbb{R}, \quad \beta > 0$
 Mean: $E[X] = \alpha.$
 Variance: $\text{var}[X] = 2\beta^2.$
 Moment gen. function: $\frac{e^{\alpha t}}{1 - \beta^2 t^2}, \quad |t| < 1/\beta.$
 Characteristic function: $\frac{e^{i\alpha t}}{1 + \beta^2 t^2}.$
Laplace distribution.
- 34.12 $f(x) = \frac{e^{-z}}{\beta(1+e^{-z})^2}, \quad z = \frac{x-\alpha}{\beta}, \quad x \in \mathbb{R}, \quad \beta > 0$
 Mean: $E[X] = \alpha.$
 Variance: $\text{var}[X] = \pi^2 \beta^2 / 3.$
 Moment generating function:
 $e^{\alpha t} \Gamma(1-\beta t) \Gamma(1+\beta t) = \pi \beta t e^{\alpha t} / \sin(\pi \beta t).$
 Characteristic function: $i \pi \beta t e^{i \alpha t} / \sin(i \pi \beta t).$
Logistic distribution.
- 34.13 $f(x) = \begin{cases} \frac{e^{-(\ln x - \mu)^2 / 2\sigma^2}}{\sigma x \sqrt{2\pi}}, & x > 0; \\ 0, & x \leq 0 \end{cases}; \quad \sigma > 0$
 Mean: $E[X] = e^{\mu + \frac{1}{2}\sigma^2}.$
 Variance: $\text{var}[X] = e^{2\mu}(e^{2\sigma^2} - e^{\sigma^2}).$
 k th moment: $E[X^k] = e^{k\mu + \frac{1}{2}k^2\sigma^2}.$
Lognormal distribution.

$$f(\mathbf{x}) = \frac{n!}{x_1! \cdots x_k!} p_1^{x_1} \cdots p_k^{x_k}$$

$$x_1 + \cdots + x_k = n, \quad p_1 + \cdots + p_k = 1,$$

$$x_j \in \{0, 1, \dots, n\}, \quad p_j \in (0, 1), \quad j = 1, \dots, k.$$

Mean of X_j : $E[X_j] = np_j$.

34.14 Variance of X_j : $\text{var}[X_j] = np_j(1 - p_j)$.

Covariance: $\text{cov}[X_j, X_r] = -np_j p_r,$
 $j, r = 1, \dots, n, \quad j \neq r.$

Moment generating function: $\left[\sum_{j=1}^k p_j e^{t_j} \right]^n.$

Characteristic function: $\left[\sum_{j=1}^k p_j e^{it_j} \right]^n.$

Multinomial distribution. $f(\mathbf{x})$ is the probability for k events A_1, \dots, A_k to occur exactly x_1, \dots, x_k times in n independent observations, when the probabilities of the events are p_1, \dots, p_k .

$$f(\mathbf{x}) = \frac{1}{(2\pi)^{k/2} \sqrt{|\Sigma|}} e^{-\frac{1}{2}(\mathbf{x}-\boldsymbol{\mu})' \boldsymbol{\Sigma}^{-1}(\mathbf{x}-\boldsymbol{\mu})}$$

$\boldsymbol{\Sigma} = (\sigma_{ij})$ is symmetric and positive definite,

$$\mathbf{x} = (x_1, \dots, x_k)', \quad \boldsymbol{\mu} = (\mu_1, \dots, \mu_k)'$$

34.15

Mean: $E[X_i] = \mu_i$.

Variance: $\text{var}[X_i] = \sigma_{ii}$.

Covariance: $\text{cov}[X_i, X_j] = \sigma_{ij}$.

Moment generating function: $e^{\boldsymbol{\mu}'\mathbf{t} + \frac{1}{2}\mathbf{t}'\boldsymbol{\Sigma}\mathbf{t}}$.

Characteristic function: $e^{-\frac{1}{2}\mathbf{t}'\boldsymbol{\Sigma}\mathbf{t}} e^{i\mathbf{t}'\boldsymbol{\mu}}$.

Multivariate normal distribution. $|\boldsymbol{\Sigma}|$ denotes the determinant of the variance-covariance matrix $\boldsymbol{\Sigma}$. $\mathbf{x} = (x_1, \dots, x_k)'$, $\boldsymbol{\mu} = (\mu_1, \dots, \mu_k)'$.

$$f(x) = \binom{x-1}{r-1} p^r (1-p)^{x-r},$$

$$x = r, r+1, \dots; \quad r = 1, 2, \dots; \quad p \in (0, 1).$$

34.16

Mean: $E[X] = r/p$.

Variance: $\text{var}[X] = r(1-p)/p^2$.

Moment generating function: $p^r (1 - (1-p)e^t)^{-r}$.

Characteristic function: $p^r (1 - (1-p)e^{it})^{-r}$.

Negative binomial distribution.

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-(x-\mu)^2/2\sigma^2}, \quad x \in \mathbb{R}, \quad \sigma > 0.$$

34.17

Mean: $E[X] = \mu$.

Variance: $\text{var}[X] = \sigma^2$.

Moment generating function: $e^{\mu t + \frac{1}{2}\sigma^2 t^2}$.

Characteristic function: $e^{i\mu t - \frac{1}{2}\sigma^2 t^2}$.

Normal distribution. If $\mu = 0$ and $\sigma = 1$, this is the *standard normal distribution*.

$$f(x) = \begin{cases} \frac{ca^c}{x^{c+1}}, & x > a; \\ 0, & x \leq a \end{cases} \quad a > 0, \quad c > 0.$$

34.18

Mean: $E[X] = ac/(c-1), \quad c > 1$.

Variance: $\text{var}[X] = a^2 c / (c-1)^2 (c-2), \quad c > 2$.

k th moment: $E[X^k] = a^k c / (c-k), \quad c > k$.

Pareto distribution.

34.19	$f(x) = e^{-\lambda} \frac{\lambda^x}{x!}; \quad x = 0, 1, 2, \dots, \quad \lambda > 0.$ <p>Mean: $E[X] = \lambda$. Variance: $\text{var}[X] = \lambda$. Moment generating function: $e^{\lambda(e^t - 1)}$. Characteristic function: $e^{\lambda(e^{it} - 1)}$.</p>	<i>Poisson distribution.</i>
34.20	$f(x) = \frac{\Gamma(\frac{1}{2}(\nu + 1))}{\sqrt{\nu\pi} \Gamma(\frac{1}{2}\nu)} \left(1 + \frac{x^2}{\nu}\right)^{-\frac{1}{2}(\nu+1)},$ $x \in \mathbb{R}, \quad \nu = 1, 2, \dots$ <p>Mean: $E[X] = 0$ for $\nu > 1$ (does not exist for $\nu = 1$). Variance: $\text{var}[X] = \frac{\nu}{\nu - 2}$ for $\nu > 2$ (does not exist for $\nu = 1, 2$). kth moment (exists only for $k < \nu$):</p> $E[X^k] = \begin{cases} \frac{\Gamma(\frac{1}{2}(k+1))\Gamma(\frac{1}{2}(\nu-k))}{\sqrt{\pi} \Gamma(\frac{1}{2}\nu)} \nu^{\frac{1}{2}k}, & k \text{ even,} \\ 0, & k \text{ odd.} \end{cases}$	<i>Student's t-distribution with ν degrees of freedom.</i>
34.21	$f(x) = \begin{cases} \frac{1}{\beta - \alpha}, & \alpha \leq x \leq \beta; \\ 0 & \text{otherwise} \end{cases}; \quad \alpha < \beta.$ <p>Mean: $E[X] = \frac{1}{2}(\alpha + \beta)$. Variance: $\text{var}[X] = \frac{1}{12}(\beta - \alpha)^2$. Moment generating function: $\frac{e^{\beta t} - e^{\alpha t}}{t(\beta - \alpha)}$. Characteristic function: $\frac{e^{i\beta t} - e^{i\alpha t}}{it(\beta - \alpha)}$.</p>	<i>Uniform distribution.</i>
34.22	$f(x) = \begin{cases} \beta \lambda^\beta x^{\beta-1} e^{-(\lambda x)^\beta}, & x > 0; \\ 0, & x \leq 0 \end{cases}; \quad \beta, \lambda > 0.$ <p>Mean: $E[X] = \frac{1}{\lambda} \Gamma(1 + \frac{1}{\beta})$. Variance: $\text{var}[X] = \frac{1}{\lambda^2} \left[\Gamma(1 + \frac{2}{\beta}) - \Gamma(1 + \frac{1}{\beta})^2 \right]$. kth moment: $E[X^k] = \frac{1}{\lambda^k} \Gamma(1 + k/\beta)$.</p>	<i>Weibull distribution.</i> For $\beta = 1$ we get the exponential distribution.

Chapter 35

Method of least squares

Ordinary least squares

The straight line $y = a + bx$ that best fits n data points $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$, in the sense that the sum of the squared vertical deviations,

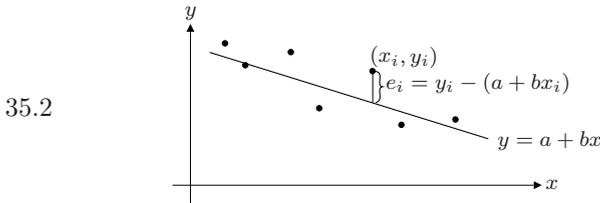

$$35.1 \quad \sum_{i=1}^n e_i^2 = \sum_{i=1}^n [y_i - (a + bx_i)]^2,$$

is minimal, is given by the equation

$$y = a + bx \iff y - \bar{y} = b(x - \bar{x}),$$

where

$$b = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2}, \quad a = \bar{y} - b\bar{x}.$$

The vertical deviations in (35.1) are $e_i = y_i - y_i^*$, where $y_i^* = a + bx_i$, $i = 1, \dots, n$. Then

$$35.3 \quad \sum_{i=1}^n e_i = 0, \text{ and } b = r(s_y^2/s_x^2), \text{ where } r \text{ is the correlation coefficient for } (x_1, y_1), \dots, (x_n, y_n). \text{ Hence, } b = 0 \iff r = 0.$$

In (35.1), the *total variation*, *explained variation*, and *residual variation* in y are defined as

- 35.4
- Total: $SST = \sum_{i=1}^n (y_i - \bar{y})^2$
 - Explained: $SSE = \sum_{i=1}^n (y_i^* - \bar{y}^*)^2$
 - Residual: $SSR = \sum_i e_i^2 = \sum_i (y_i - y_i^*)^2$

Then $SST = SSE + SSR$.

Linear approximation by the *method of least squares*.

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i,$$

$$\bar{y} = \frac{1}{n} \sum_{i=1}^n y_i.$$

Illustration of the method of least squares with one explanatory variable.

$$s_x^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2,$$

$$s_y^2 = \frac{1}{n-1} \sum_{i=1}^n (y_i - \bar{y})^2.$$

The total variation in y is the sum of the explained and the residual variations.

The correlation coefficient r satisfies

$$35.5 \quad r^2 = \text{SSE}/\text{SST},$$

and $100r^2$ is the percentage of explained variation in y .

Suppose that the variables x and Y are related by a relation of the form $Y = \alpha + \beta x$, but that observations of Y are subject to random variation. If we observe n pairs (x_i, Y_i) of values of x and Y , $i = 1, \dots, n$, we can use the formulas in (35.1) to determine least squares estimators $\hat{\alpha}$ and $\hat{\beta}$ of α and β . If we assume that the residuals $\varepsilon_i = y_i - \alpha - \beta x_i$ are independently and normally distributed with zero mean and (unknown) variance σ^2 , and if the x_i have zero mean, i.e. $\bar{x} = (\sum_i x_i)/n = 0$, then

35.6

- the estimators $\hat{\alpha}$ and $\hat{\beta}$ are unbiased,

- $\text{var}(\hat{\alpha}) = \frac{\sigma^2}{n}$, $\text{var}(\hat{\beta}) = \frac{\sigma^2}{\sum_i x_i^2}$.

$r^2 = 1 \Leftrightarrow e_i = 0$ for all i
 $\Leftrightarrow y_i = a + bx_i$ (exactly)
 for all i .

Linear regression with one explanatory variable.

If the x_i do not sum to zero, one can estimate the coefficients in the equation $Y = \alpha + \beta(x - \bar{x})$ instead.

Multiple regression

Given n observations (x_{i1}, \dots, x_{ik}) , $i = 1, \dots, n$, of k quantities x_1, \dots, x_k , and n observations y_1, \dots, y_n of another quantity y . Define

$$35.7 \quad \mathbf{X} = \begin{pmatrix} 1 & x_{11} & x_{12} & \dots & x_{1k} \\ 1 & x_{21} & x_{22} & \dots & x_{2k} \\ \vdots & \vdots & \vdots & & \vdots \\ 1 & x_{n1} & x_{n2} & \dots & x_{nk} \end{pmatrix},$$

$$\mathbf{y} = \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{pmatrix}, \quad \mathbf{b} = \begin{pmatrix} b_0 \\ b_1 \\ \vdots \\ b_k \end{pmatrix}$$

The coefficient vector $\mathbf{b} = (b_0, b_1, \dots, b_k)'$ of the hyperplane $y = b_0 + b_1 x_1 + \dots + b_k x_k$ that best fits the given observations in the sense of minimizing the sum

$$(\mathbf{y} - \mathbf{Xb})'(\mathbf{y} - \mathbf{Xb})$$

of the squared deviations, is given by

$$\mathbf{b} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}.$$

The method of least squares with k explanatory variables.

\mathbf{X} is often called the *design matrix*.

In (35.7), let $y_i^* = b_0 + b_1x_{i1} + \cdots + b_kx_{ik}$. The sum of the deviations $e_i = y_i - y_i^*$ is then $\sum_{i=1}^n e_i = 0$.

- 35.8 Define SST, SSE and SSR as in (35.4). Then $SST = SSE + SSR$ and $SSR = SST \cdot (1 - R^2)$, where $R^2 = SSE/SST$ is the *coefficient of determination*. $R = \sqrt{R^2}$ is the *multiple correlation coefficient* between y and the explanatory variables x_1, \dots, x_k .

Suppose that the variables $\mathbf{x} = (x_1, \dots, x_k)$ and Y are related by an equation of the form $Y = \beta_0 + \beta_1x_1 + \cdots + \beta_kx_k = (1, \mathbf{x})\boldsymbol{\beta}$, but that observations of Y are subject to random variation. Given n observations (\mathbf{x}_i, Y_i) of values of \mathbf{x} and Y , $i = 1, \dots, n$, we can use the formulas in (35.7) to determine a least squares estimator $\widehat{\boldsymbol{\beta}} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{Y}$ of $\boldsymbol{\beta}$. If the residuals $\varepsilon_i = y_i - (1, \mathbf{x}_i)\boldsymbol{\beta}$ are independently distributed with zero mean and (unknown) variance σ^2 , then

- 35.9
- the estimator $\widehat{\boldsymbol{\beta}}$ is unbiased,
 - $\text{cov}(\widehat{\boldsymbol{\beta}}) = \sigma^2(\mathbf{X}'\mathbf{X})^{-1}$,
 - $\hat{\sigma}^2 = \frac{\hat{\boldsymbol{\varepsilon}}'\hat{\boldsymbol{\varepsilon}}}{n - k - 1} = \frac{\sum_i \hat{\varepsilon}_i^2}{n - k - 1}$,
 - $\widehat{\text{cov}}(\widehat{\boldsymbol{\beta}}) = \hat{\sigma}^2(\mathbf{X}'\mathbf{X})^{-1}$.

Definition of the coefficient of determination and the multiple correlation coefficient. $100R^2$ is percentage of explained variation in y .

Multiple regression.

$\boldsymbol{\beta} = (\beta_0, \beta_1, \dots, \beta_k)'$ is the vector of regression coefficients;

$\mathbf{x}_i = (x_{i1}, \dots, x_{ik})$ is the i th observation of \mathbf{x} ;

$\mathbf{Y} = (Y_1, \dots, Y_n)'$ is the vector of observations of Y ;

$\hat{\boldsymbol{\varepsilon}} = (\hat{\varepsilon}_1, \dots, \hat{\varepsilon}_n)'$

$\mathbf{Y} - \mathbf{X}\widehat{\boldsymbol{\beta}}$;

$\text{cov}(\widehat{\boldsymbol{\beta}}) = (\text{cov}(\beta_i, \beta_j))_{ij}$ is the $(n + 1) \times (n + 1)$ *covariance matrix* of the vector $\boldsymbol{\beta}$.

If the ε_i are normally distributed, then $\hat{\sigma}^2$ is an unbiased estimator of σ^2 , and $\widehat{\text{cov}}(\widehat{\boldsymbol{\beta}})$ is an unbiased estimator of $\text{cov}(\boldsymbol{\beta})$.

- Slutsky’s theorem, 199
- Solow’s growth model, 179
- source (equilibrium point), 79
- span (of a set of vectors), 128
- spectral theorem (for matrices), 147
- sporadically catching up optimality (SCU-optimality), 118
- stability
 difference equations, 65–68
 differential equations, 71, 74, 75, 78–80
- standard deviation, 195
- standard normal distribution, 204
- stationary point, 97
- statistical testing, 199
- Stirling’s formula, 60
- stochastic control problem, 185
- stochastic dominance
 first degree, 181, 182
 second degree, 182
- stochastic independence, 193, 197
- stochastic integral, 184
- stochastic variables
 one-dimensional, 194
 two-dimensional, 196
- Stolper–Samuelson’s theorem, 175
- Stone–Geary’s utility function, 172
- strategy profile (game theory), 187
- strategy set (game theory), 187
- strict concavity/convexity of functions, 91
- strictly decreasing/increasing functions, 10, 11
- strictly dominated strategy, 188
- strictly increasing differences, 160
- strict quasiconcavity (convexity) of functions, 94
- strict supermodularity, 160
- strong law of large numbers, 200
- Student’s t -distribution, 205
- subgradient, 32
- sublattice, 43
- subsequence, 84
- subset, 1
- subspace (of \mathbb{R}^n), 127
- substitution matrix, 163
- sufficient condition, 1

- supergradient, 32
 supermodular function, 160
 supply function, 164
 supremum (sup), 87
 supremum distance, 42
 surjective function, 5
 Sylvester's inequality, 136
 symmetric difference of sets, 2
 symmetric game, 189
 symmetric matrix, 136
 symmetry of graphs, 10
- tangent function (tan), 14, 15
 tangent (hyper)plane, 31, 32
 tangent (to a curve), 13
 Tarski's fixed point theorem, 43
 Taylor series, 51
 Taylor's formula, 50, 51
 t -distribution (Student's), 205
 test statistics, 199
 total ordering, 3
 total variation, 207, 209
 trace (of a matrix), 136
 trajectory, 77
 transformation, 41, 157
 transformation of stochastic variables, 198
 translog cost function, 168
 translog indirect utility function, 173
 transpose (of a matrix), 134
 transversality conditions
 - in calculus of variations, 111, 112
 - in control theory, 113, 114
 trapezoid formula, 61
 triangle inequalities
 - in metric space, 129
 - in \mathbb{R} (or \mathbb{C}), 47
 trigonometric formulas, 15–17
 trigonometric functions, 14
 truth tables (for logical operators), 1
 2×2 -factor model, 175
 two-person game, 189
 type I and type II errors, 200
- unbiased estimator, 198
- uncorrelated random variables, 196
 uniform continuity, 22, 85
 uniform convergence, 86
 uniform distribution, 205
 uniformly bounded set (in $C(X)$), 130
 union of sets, 2
 unitary elastic function, 35
 unitary matrix, 140
 unit matrix, 133
 universal set, 2
 unstable equilibrium point, 67, 78
 upper bound, 4
 upper hemicontinuity, 86
 upper level (contour) set, 93
 upper triangular matrix, 133
 utility function 169
 - indirect, 170
 utility maximization, 169
- value (of a game), 189
 value function
 - control theory, 114
 - discrete dynamic programming, 123, 124
 - static optimization, 103, 104, 109
 Vandermonde's determinant, 142, 143
 variance, 194, 195, 197
 variation of parameters, 73
 vec-operator, 156
 vectors, 127–132
 vector space, 129
 Viète's rule, 7
 volatility, 183
- weak law of large numbers, 200
 weak ordering, 3
 Weibull distribution, 205
 Weierstrass's theorem, 97
 weighted means, inequality, 47
- Young's (or Schwarz's) theorem, 27
- zeros (of a polynomial), 8
 zero-sum game, 189
 Zorn's lemma, 4
